 being eligible. The seedling must not  
 have been previously disseminated, and  
 the award will be made by the Society's  
 judges.

### Chrysanthemum Society of America.

**Seedlings.**—The committees judging  
 new seedlings will be in session this and  
 every Saturday up to and including No-  
 vember 27.

Exhibitors should make their entries (a  
 fee of \$2 is charged for each variety ex-  
 hibited) to the secretary, not later than  
 Tuesday of the week in which the blooms  
 are to be shown.

Blooms may be sent to any of the fol-  
 lowing addresses, express prepaid:

Boston.—A. H. Fewkes, Horticultural  
 Hall.

New York.—Eugene Dalledouze, care  
 of Dr. F. M. Hexamer, Madison Square  
 Garden.

Philadelphia.—Edwin Lonsdale, 1514  
 Chestnut street.

Cincinnati.—B. Witterstaetter, corner  
 Fourth and Walnut streets.

Chicago.—W. N. Rudd, room 202, 185  
 Dearborn street.

**Silver Cup.**—The Chrysanthemum So-  
 ciety's Silver Cup, to be offered annually,  
 will be awarded to the best six varieties,  
 six blooms each (36 blooms in all). The  
 first cup will be competed for October 21  
 at New York. Competitors should for-  
 ward their blooms to Dr. F. M. Hexa-  
 mer, Madison Square Garden, New York  
 City, express prepaid. Competition open  
 to all, no entry fee. For further particu-  
 lars address Elmer D. Smith, secretary,  
 Adrian, Mich.

### New York.

#### A November Show.

The New York Gardeners' Society  
 announces that it will hold a grand  
 floral exhibition in the city on November  
 12 and 13. The preliminary schedule is  
 already out and makes provision for  
 plants, Chrysanthemums, Roses, Carna-  
 tions, and fruit. There are two sections,  
 the larger one for private gardeners only,  
 the other open to all. This display will  
 be held in the new Hotel Astoria, Thirty-

fourth street and Fifth avenue, and is  
 under the patronage of the leading society  
 ladies of New York, as many as forty-  
 two names appearing on the list. The  
 exhibition will be under the management  
 of Mr. J. H. Troy, whom intending con-  
 tributors should address at 365 Fifth  
 avenue.

#### Gardeners' Society Meeting.

The New York Gardeners' Society  
 held its regular monthly meeting Sat-  
 urday, October 9; 47 members and  
 others were in attendance. One of the  
 chief attractions of the evening was a  
 lecture by the celebrated Orchid collector,  
 John E. Lager, who gave an account of  
 his recent experiences in the tropics; he  
 also discoursed upon the cultivation of  
 Orchids in this country, enlarging upon  
 the necessity of adopting more rational  
 modes of treatment.

A. Wengerter, Bay Ridge, exhibited  
 some fine vases of President Carnot,  
 Kaiserin Augusta, and Perle Roses.

The following gentlemen were elected  
 as associate members: W. E. Marshall,  
 Lyman Crow, and James W. Withers.

#### The American Institute Show.

The horticultural exhibition at the  
 American Institute Fair at Madison  
 Square Garden continues to grow in vol-  
 ume and interest as time goes on, so  
 great is the interest manifested in this  
 part of the great fair that the manage-  
 ment has decided to continue it over the  
 fifth week, so that it will not close till  
 October 30. The additional or what will  
 be known as the last week will be almost  
 entirely devoted to Chrysanthemums,  
 Roses, Carnations, and Orchids. During  
 the present week exotic plants, cut flow-  
 ers, Cyclamen, and Geraniums are the  
 features. Among fruits, apples, and  
 pears are the attraction, also Southern  
 fruits and Dates from California and Ar-  
 zona. Vegetables are also well represented.

Next week, beginning October 18, will  
 be the Chrysanthemum and Rose show,  
 and despite the early date a great exhibi-  
 tion is expected. On Thursday special  
 interest will be centered on the National  
 Chrysanthemum Society's cup contest,  
 which calls for a display of six varieties,  
 six blooms of each.

So far we have omitted to mention a  
 special feature of the week's display and  
 one which merits more than passing men-  
 tion. This is a collection of Colum-  
 bian grasses collected and exhibited by J.  
 E. Lager, in all over 500 species, many of  
 which are unknown and have never been  
 named. Messrs. Lager & Hurrell also  
 stage in front of this exhibit a group of  
 Colombian Orchids, also one raft or  
 board showing their new mode of Orchid  
 culture. This board, 66 inches in length,  
 is covered with Cattleya Trianae, show-  
 ing 32 sheaths and wonderful vigor of  
 plant. This last in fact is true of all the  
 pieces staged, several of which are yet in  
 their original state, having never been  
 blocked or placed on boards, but are sub-  
 sisting on their natural blocks. Special  
 awards were made to both these exhib-  
 its.

#### The Florists' Club Medal.

The Florists' Club, at its meeting  
 on Monday last, decided to give its gold  
 medal, valued at \$100, to the exhibitor  
 scoring the highest number of points for  
 displays made at the monthly meetings  
 of the Club held during 1898. At the No-  
 vember meeting a silver medal will be  
 offered for the best vase of 25 Chrys-  
 anthemum blooms, not less than five varie-  
 ties. These competitions are open to all.

#### A Reflection.

It is only within a year or so that the  
 private gardeners of the country began  
 to band themselves together in the vari-  
 ous sections for the purpose of mutual  
 improvement; and already the beneficial  
 influence of such organization is being  
 demonstrated in the increased number of  
 floral exhibitions to be given this fall  
 under the auspices of the gardeners' socie-  
 ties in rural districts adjacent to the me-  
 tropolis. In this respect the gardeners  
 are showing more aggressiveness than  
 the commercial florists, although, of  
 course, the co-operation of the latter is  
 often sought and obtained in these ven-

tures. Evidences that the private gardeners are coming to the front in other directions as well, and to all appearances superseding their more apathetic confreres, the florists, are seen in the election of gardeners as officers in our florists' clubs, e. g., New York, where the positions of president and vice-president are both filled by private gardeners. All this goes to show that the trend of the times is toward a reversal of conditions of former days, when the commercial man was the dominant factor, and the private gardener played but a subsidiary part. [And this is just what AMERICAN GARDENING has always held should be.—ED.]—Florists' Exchange.

### Coming Exhibitions.

**Sept. 27 to Nov 4—NEW YORK:** American Institute (Horticultural Section), Madison Square Garden. James W. Withers, Box 1697, superintendent.

**Nov. 2-5—BOSTON:** Massachusetts Horticultural Society, Horticultural Hall. Robert Manning, secretary.

**Nov. 3-4—MORRISTOWN, N. J.:** Morris County Gardeners' and Florists' Club, McAlpin's Hall. W. H. Thomas, Convent Station, N. J., secretary.

**Nov. 3-5—FORT WAYNE, IND.**

—POUGHKEEPSIE, N. Y.: Dutchess County Horticultural Society, Armory. Wallace G. Gomersall, Fishkill-on-Hudson, N. Y., secretary.

**Nov. 3-6—INDIANAPOLIS, IND.:** State Florists' Association of Indiana, Tomlinson Hall. R. A. McKeand, Garfield Park, secretary.

**Nov. 4-6—NORTHAMPTON, MASS.:** Northampton Horticultural Society, City Hall. E. J. Canning, Smith College Botanic Gardens, secretary.

—NEW BEDFORD, MASS.: Gardeners' and Florists' Club, Adelphi Rink. A. J. Fish, secretary.

**Nov. 5 and 6—PORT CHESTER, N. Y.:** The Westchester County Gardeners' Association, Fehr's Opera House. A. Grierson, Rye, N. Y., secretary.

**Nov. 9-11—SYRACUSE, N. Y.:** Central New York Horticultural Society, in the Alhambra. D. Campbell, secretary.

—WORCESTER, MASS.: Worcester County Horticultural Society. Adin A. Hixon, Worcester, Mass., secretary.

**Nov. 9-12—MT. KISCO, N. Y.:** Bedford Flower Club, under management of Westchester County Horticultural Society, Opera House. H. Spavins, Box 52, Secretary.

**Nov. 9-13—CHICAGO:** Horticultural Society, Armory, Lake Front. W. N. Rudd, Room 202, 185 Dearborn street, manager.

—MILWAUKEE, WIS.: Florists' Club, Lincoln Hall. A. Klokner, manager.

—PHILADELPHIA: Pennsylvania Horticultural Society, Horticultural Hall, Broad street. David Rust, secretary.

**Nov. 10-12—SPRINGFIELD, MASS.:** Hampden County Horticultural Society, International Chrysanthemum Exhibition. William F. Gale, 381 Main street, manager of exhibitions.

—WACO, TEX.: Waco Floral Society. Mrs. M. B. Davis, secretary.

**Nov. 10-13—LOUISVILLE, KY.:** Kentucky Society of Florists. F. C. Haupt, 241 W. Jefferson street, secretary.

—TORONTO, ONT.: Gardeners' and Florists' Association, The Pavillon. E. H. Carter, 280 Gerrard street, East, secretary.

**Nov. 11-13—PROVIDENCE, R. I.:** Rhode Island Horticultural Society, Music Hall. Charles W. Smith, 61 Westminster street, secretary.

**Nov. 12 and 13—NEW YORK:** N. Y. Gardeners' Society, Hotel Astoria, 34th street and Fifth avenue. J. H. Troy, manager, 865 Fifth avenue.

**Nov. 16-19—CLEVELAND, OHIO:** Florists' Club. G. A. Tilton, 85-87 Woodland avenue, secretary.

**Nov. 20—BOSTON, MASS.:** Horticultural Society's Prize Exhibition, Horticultural Hall. Robert Manning, secretary.

**Not Fixed—SAN FRANCISCO, CAL.:** California State Floral Society. Enory E. Smith, manager.

**ARMISTEAD & McKELVEY** Pittsburgh.  
**REYNOLDS-BAUMAN** Pittsburgh.

## WHEN BUILDING

a new house or barn, or in putting new roofing or siding on those you already have, a little inquiry into the value of **CORRUGATED IRON AND STEEL ROOFING AND SIDING** will repay you handsomely. It is cheaper than boards or shingles, because the first cost is no greater and the lasting qualities are double. No body knows how long it will last if kept properly painted. A **GOOD CORRUGATED STEEL ROOF** at 2 1/2 cts. per square foot. For testimonials, circulars and estimates, address **THE BERLIN IRON BRIDGE CO., E. BERLIN CONN.**

When Writing Mention Florists' Exchange

## HENS AND EGGS

Undoubtedly there are many readers of AMERICAN GARDENING who keep hens who do not take a poultry paper; possibly some take the wrong one. Gardening, fruit culture and poultry keeping dovetail together perfectly, each filling a season comparatively dull in the others.

Realizing the above facts, we have arranged with the publishers of **POULTRY MONTHLY**, to offer that journal in club with **AMERICAN GARDENING**, for the coming subscription season, both journals postpaid, one year, for the **SMALL SUM OF \$1.25.**

**POULTRY MONTHLY** is now in its nineteenth year; it has always been recognized as the leading publication in its particular field. Sound and reliable in its teachings, and not the mouthpiece of cranks, cliques, or rings. Its correspondents are practical and successful men, in the harness to-day. The publishers of **AMERICAN GARDENING** recommend *Poultry Monthly* as being one of the very best poultry papers issued, and advise all interested to accept this Great Combination Offer.

### A WONDERFUL OFFER!

**American Gardening** (Weekly), \$1.00 } **Both \$1.25**  
**Poultry Monthly**, - - 1.00 } One Year, postpaid.

Present subscribers who are in arrears must pay up in full to become eligible to this offer.  
 Address **AMERICAN GARDENING, P. O. Box 1697, New York City.**

## ALL ABOUT THE HOME PLOT

## POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

## Started Cyclamen Bulbs.

The great beauty and the lasting qualities of the Cyclamen push it more strongly into favor with every passing year. Those who are best satisfied with it, however, have bought it as a plant rather than as a dry bulb. It is at just this point of starting the bulb that so many meet failure. Generally, it is better, either to raise it from seed for one's self, or to buy the bulbs from a florist after they are properly started. Many firms now sell them in this condition.

## Grevillea Robusta.

Several times in the past these notes have contained references to the Grevillea as grown from seed, not so flattering as those usually seen. It is but fair to say that now, at 18 months old, the house-grown Grevilleas are really taking the place assigned them in the descriptions. The plants have several points to recommend them. They lose no foliage, thus keeping well clothed almost to the pot; even if some of the lower leaves were lost, the drooping habit of the foliage would almost conceal the fact. The plants are symmetrical to an unusual degree. And while the young growth is the unstimulating, dry atmosphere of the living room has not the perfection of glossy beauty attributed to it in the descriptions, it forms, nevertheless, a beautiful plant, and satisfactory above the average. The seedlings have been grown both indoors and outside, doing well under both conditions.

## Early Flowering Bulbs.

Since November and December are the months of scarcity of bloom, it behooves the window gardener to make careful selection of bulbs for this season. Most of the various lists contain some sorts that bloom earlier than others. Early potting, of course affects all, and is desirable. The Roman Hyacinths and the Paper White Narcissus are of the earliest. These come in ahead of the general lists. Among Tulips, careful selection must be made. The class known as the Duc von Thols are early, and can be had in carmine, scarlet, white, and yellow. Among others, the beautiful pink Cottage Maid is late. Rose Grisdelin is early. In Hyacinths, La Tour d'Auvergne, Norma, Flevo, and Baron von Thuyll are to be chosen. Harrisii is the early Lily. The Ixias are late blooming bulbs, but Ixia

crateroides is the earliest, and one of the most brilliant.

## Favorite Hyacinths.

In the most select lists, those containing sorts which have fine spikes, well set with good bells, are always found La Tour d'Auvergne, La Grandesse, Flevo, Robert Steiger, the three beautiful yellows, Goethe, Heroine, and Ida, Noble par Merite, Czar Peter, Othello (so-called black), and Queen of Hyacinths. This last is described by some as dark red; by others as bright scarlet. All of these will be found in the lists of sorts shown at the foremost exhibitions. What is good enough for the florist is surely good choice for the amateur. But the price must be paid, and these are not cheap.

## Cockade and Other Hyacinths.

The various minor classes of Hyacinths seem to be growing in popularity. Distinct among these are the Cockade Hyacinths, which grow from a small spike like a cockade, into a feathery plume several times as large. As this development is slow, one may get several weeks of pleasure from a single pot of bulbs. Another species, known as Belgicus, seems to come between the Grape Hyacinth and the larger sorts. The tiny Grape Hyacinths, set thickly in pots or pans, are finding favor also. It is hardly necessary to mention the Roman Hyacinths, as they have made their own place, and it is a large one. But there is a variation, known as Dutch Roman, or Miniature Hyacinths, which are classed as almost as good as the standard Dutch sorts. All these minor divisions of the great Hyacinth family have cheapness to recommend them, some being as low as 20c. a dozen. Between this and the \$2 a dozen, asked for exhibition Dutch bulbs, is a range wide enough for every purse.

## The "Yellow Hyacinths."

Most certainly, a yellow Harrisii, were it in sight, would be a welcome addition to our list of desirable winter blooming bulbs. The Lily that is offered this season under the above name, is known to the general public as Parryi. It has been considered a difficult sort to ship long distances, and has been thought to need a cool, and partly shaded, location outside. Those who undertake to grow it, should keep this requirement in mind.

## Distemper in Fowls.

It is customary with some to name every case of discharge or swelling about the head in fowls as roup or its beginnings. Others are pleased to call these beginnings by the wide-reaching name of "distemper." For any or all these ailments (and they are all due, primarily, to catching cold) aconite acts well as a remedy; if there is fever, it is all the more

indicated. Whenever there is canker, or lighter coatings of the mouth and throat, powdered borax, puffed on the surface with an air gun, is an excellent remedy. It can even be blown into the eyes, if they are swollen and mattery. It is not well, however, to trust to any remedy, if the cause for the disease has not been ferreted out, and rendered inoperative.

## Post-Mortems on Fowls

Sometimes a post-mortem examination is the only thing that will reveal the cause of sickness and death in the flock; and, though unpleasant, it may be necessary in order to prevent the spread of disease. Whatever the family, there is almost always one person in it who knows how to dissect a fowl. If no one else has the requisite knowledge, the cook can always be appealed to, either for the work itself, or for instruction as to its details. This suggestion is for the benefit of the occasional novice who falls into inextricable difficulty at this point; Separate Yards.

There are many leaving the city and taking up country life, who gain a large part of their pleasure from fussing with various sorts of fowls. Chickens alone do not satisfy them. They want a peacock, perhaps, some guinea fowls, some ducks, possibly even geese. Judging from what is usually found in the poultry papers, they believe it to be absolutely necessary, if all these are kept, to assign them separate quarters. While this might be the better plan, it is not a necessity if there is a reasonable amount of room. It is customary on farms for poultry of all sorts to run together about the farm yards, and there is seldom any interference between the breeds, especially if they are raised together. It is said, however, that peacocks sometimes attack young chickens and kill them.

## Getting a Good Strain.

The variation between different strains of the same breed, is little understood by those who have not had experience. One may buy White Wyandottes, for instance, of a fancier who has inbred his fowls till they have no stamina left. Again, one may buy fowls of the same breed from another whose birds are but fairly good in vigor and in laying qualities. Or, from a third breeder one may get birds, also White Wyandottes, of exceptional thrift and vigor, and having exceptionally good laying powers. In the first two cases he will condemn, in the other, exalt the breed. It is better to buy from stock one knows, if possible.

## Defects in Fowls Due to Treatment.

The subject of wry tails and crooked breasts springs up in the path of every beginner in the art of raising fancy poultry in good condition. The cause

NOW READY.

## The Water Garden

BY WILLIAM TRICKER.

PRICE, \$2.00. 25 per cent. off to subscribers to American Gardening and Florists' Exchange.

This work contains nine beautiful plates, eighteen full page descriptive views of leading Water Gardens and Ponds, and numerous smaller pictures prepared with special reference to this work.

On heavy enamelled paper. Elegantly bound. Large octavo.

The text describes all operations from the growing of plants in tubs to the large water garden, excavation of grounds, construction of ponds, adapting natural streams, planting, hybridizing, seed saving, propagation, the aquatic house, wintering, correct designing and planting of banks and margins, and all other necessary details.

A. T. DE LA MARE PTG. & PUB. CO. LTD., Nos. 2 to 8 Duane Street, P. O. Box 1697, New York City.

being known, these defects can be mainly avoided. They are sometimes due to inherited weakness. At other times they are the direct result of crowding the young stock, or of allowing the chicks to roost, while the bones are still in the softest cartilaginous state. Let the coops be without corners, the chicks uncrowded, and, later, the first roosts broad and firm, and there will be little difficulty with stock of good constitution.

#### New Breeds Coming Untrue.

Beginners need to be told that the progeny of any new breed may be expected to throw back in the direction of one or other of the breeds which have formed it, and thus show characteristics which may make them seem impure. The Rose-combed Orpington, for instance, having Langshan blood in its ancestry, still shows feathered legs, and single combs among its progeny. Even the Silver Wyandotte, for all the many years it has been before the public, sometimes shows both these faults, as well as others. Different strains show much variation in this respect, some throwing many "off" birds, others coming nearly true—surprisingly so, indeed.

#### The Narcissus Family.

Is there one other to which the window worker is so wholly indebted? In it is found the Paper White Narcissus, a delightful friend in the need of dull November. In it the great yellow Daffodil, so popular for personal adornment. In it, too, are the incomparable chalice-flowered beauties. The Chinese Sacred Lily needs but to be mentioned to make the family seem indispensable, while the lovers of the sweet Jonquills number all who ever grew them. That gem among pot bulbs, the Bulbocodium, or Hoop-petticoat Narcissus, surely does no discredit, even to so useful and handsome a family, while many other members are less popular simply because they are less well known. Cheapness, too, is a pleasing attribute of most of the family.

MYRA V. NORRIS.

### Autumn Flowering Shrubs.

NOTES FROM THE BOTANIC GARDENS OF SMITH COLLEGE, NORTHAMPTON, MASS.

*Desmodium penduliflorum* is one of the very best autumn flowering shrubs we have. It is of dwarf bushy habit, being not more than four or five feet in height. The stems are well clothed with trifoliate leaves, the lower leaflets being some three inches long, by one and one-half inches wide, while the upper leaflets are small, not more than an inch in length. The rosy purple, pea-shaped flowers are produced in the greatest profusion on long, leafy drooping panicles, and are very showy at this date (September 26). The variety *alba* is also good, but with us it is not as free flowering as the *penduliflorum*. Both die back to the ground each winter, but seem to come up more vigorously every spring. It is a most useful subject either in masses or in the front line of the shrubbery border.

We have a mass of the Groundsel tree (*Baccharis halimifolia*) in flower just now on a grassy hillside, and it is very effective. It is called the Groundsel tree because the flowers are like those of the common Groundsel consisting chiefly of a white pappus. It also belongs to the same family (compositæ). It is of an upright, bushy habit and grows about five feet in height with us. The leaves are small, obovate in outline, with coarsely-toothed edges. The flowers are borne in large terminal panicles and flowering at this season it is worth a place in every collection.

*Comanthospace subniveolata* is a subshrub belonging to the Mint family, and a native of Japan. The leaves are opposite, lanceolate, four inches long by one and a half wide. The stems are much branched towards the summit and about three feet in height. The flowers are yellow, and are produced in spikes three to six inches in length on the ends of all the branches. I believe it to be perfectly hardy, but as we only received it last year, we gave it a slight protection last winter until we could prove its hardiness. For the front line of a shrubbery

border, or planted in a mass, we consider this a useful shrub.

*Berchemia volubilis*, the common Supple Jack, is attractive just now with its terminal panicles of cream-colored flowers. It is a good subject for climbing over stone walls or fences or covering up unsightly places.

On a hillside where we have a number of ericaceous plants grouped, a mass of the Scotch Heath (*Calluna vulgaris*) has been very attractive for some time past; the bright green foliage and tiny bell-shaped flowers are very pretty. *Erica vagans* is also a charming plant for grouping; it is of much stiffer habit than the Scotch Heath, with pink flowers rather longer than those of the Scotch Heath. We protect these two Heaths in winter with a few leaves among them and a few Hemlock or Pine branches over them. For propagating we lift and pot two or three plants of each, cut them back and after they have become established in their pots place them in a moderately warm greenhouse. Fresh young growths soon appear which as soon as the tips become just "firm," are taken as cuttings and inserted thickly in shallow pans filled with white sand and pressed firmly. The pans are plunged in the propagating bed, and a bell glass placed over them. The moisture which collects in the bell glass must be wiped out once or twice a day. As soon as the cuttings begin to make roots, admit air by tilting the bell glass, and as soon as rooted remove altogether. The cuttings generally take about three weeks to root. We propagate all our Heaths in this manner, and although there may be other admirable methods of propagating Heaths we can generally root 99 per cent. in the way I have stated.

Although this garden has only been established little more than four years, we have now growing over 4,000 shrubs in about 375 species. They are grouped in families in natural sequence around the College buildings and in other parts of the campus. In addition, we have planted some 200 different species of trees and conifers, and about 1,200 different species of hardy flowers. Seven greenhouses have been built, including a large Palm house, and are now well filled with a large variety of plants both of botanical and ornamental interest.

TEN CENTS

Feeds ten plants ten months.

Essex Flower food imparts vigor to house plants. Flow they thrive in winter is no longer the florist's secret.

If your dealer does not have the ten cent package, it will be mailed to you for eight ac. stamps by the **RUSSIA CEMENT CO.,** Gloucester, Mass.

Mention American Gardening when you write.

## Nitrate of Soda

is the best and cheapest form in which you can buy nitrogen (or ammonia). It is also the most soluble and available form in which nitrogen can be applied as food for plants. You can mix it yourself with other materials in just the correct proportion for the particular crop to which you wish to apply it. You cannot raise good crops without nitrogen in some form. Why not use the best—Nitrate?

**Free** A 40-page book, "Food for Plants." Tells all about mixing and using fertilizers. Please ask for it.

# WHOLESALE MARKETS.

## New York.

There is a general improvement in the cut flower trade. Chrysanthemums are becoming plentiful, although growers claim that the season is ten days late. The varieties now on the market with the order of arrival are: Mdme. Gasteller, Lady Fitzwygram, Marquis de Montmort, Mdme. F. Bergmann, Marion Henderson, Glory of the Pacific, Merry Monarch, Yellow Monarch, and John E. Lager.

The fruit and vegetable market is crowded with stock, and demand and values are nominal. The season is not sufficiently started to yield any results for fancy fruits, etc. The only things in the fancy trade that is making any particular prices worth noting are the new chestnuts, Paragon, Numbo, and others. These are being eagerly sought after, and \$10 to \$12 per bushel is the regular price. Retailers with fancy trade, since seeing Mr. Parry's exhibit at the American Institute, are still more eager for them, and now they are inquiring where they can obtain them in the burr.

Mushrooms are abundant and realize 60 to 75c. per pound.

Apples are being offered at high figures, but the demand is not brisk. The warm weather also interferes with the trade.

Apples—Jonathan, western, per barrel, \$4@4.50; Missouri Pippin, western, per barrel, \$3.50@4; Albemarle Pippin, Virginia, per barrel, \$4@4.50; Wine Sap, Virginia, per barrel, \$3.50@4; Johnsons' Winter, Virginia, per barrel, \$3.50@4.50; Fall Pippin, hand-picked, per d.-h. barrel, \$2@2.50; Twenty-Ounce, hand-picked, per d.-h. barrel, \$2@2.50; King, hand-picked, per d.-h. barrel, \$2.25@3; Ben Davis, western, per barrel, \$2.50@3; Jersey, per barrel, \$2@2.50; Greening, hand-picked, per d.-h. barrel, \$1.50@2; Baldwin, hand-picked, per d.-h. barrel, \$1.50@2; mixed varieties, fair to good, per barrel, \$1.75@2; poor to fair, per barrel, \$1.25@1.50; Jersey, winter, open heads, \$1@1.25.

Peaches—Jersey, extra, selected, per basket, \$1@1.25; choice per basket, 80@90c.; fair to good, per basket, 60@75c.; common, per basket, 40@50c.

## The Lion and the Lamb.

It matters little what kind of animals you confine in adjacent lots, provided the division fence is strictly "stock proof." Here surely, "the best is the cheapest."

Pears—Bartlett, large, clean, per barrel, \$2.50@3; poor to fair, per barrel, 50c.@\$2; per bushel box, 50c.@\$1.50; Seckle, per barrel, \$2.50@5; per bushel box, \$1.25@2.25; Beurre Bosc, per barrel, \$1.50@3; Sheldon, per barrel, \$1.50@2.25; Kieffer, Jersey, per barrel, \$1.75@2; Beurre d'Anjou, per barrel, \$1.25@1.75; other late sorts, fair to good, per barrel, \$1@1.50.

Quinces—Apple, good to prime, per barrel, \$2@3; poor to fair, per barrel, \$1.25@1.75.

Grapes—Delaware, Keuka, per small basket, 13@15c.; other state, per small basket, 11@13c.; Niagara, western N. Y., per small basket, 9@11c.; per 20-pound basket, 35c.; Catawba, western N. Y., per small basket, 10@11c.; Concord, up-river, per case, 40c.; western N. Y., per large basket, 10@11c.; western N. Y., per small basket 6@6½c.; black varieties, up-river, per small basket, 6c.

Wine grapes—White kinds, in trays, per pound, 1½@2c.; Delaware, in trays, per pound, 2@2½c.; black kinds, in trays, per pound, 1¼@1½c.

Plums—French prune, per 8@10-pound basket, 35@40c.; German prune, 8@10-pound basket, 20@30c.; Gage and Keine Claude, 8@10-pound basket, 15@20c.; Damson, per 8@10c. pound basket, 10@15c.; up-river, per crate, 30@35c.

Nuts—Chestnuts, northern, per bushel, 60 pounds, \$5.50@6.50; southern, per bushel, 60 pounds, \$5@6.50; Hickory nuts, per bushel, 50 pounds, \$1.50.

Cauliflowers—Fancy, per barrel, \$1.75@2.25; poor to fair, per barrel, \$1@1.50.

Celery—Choice to fancy, large, per dozen, 25@35c.; fair to prime, per dozen, 15@20c.; small and poor, per dozen, 10@12c.

Corn—Per 100, 75c.@\$1.25.

Cabbages—Jersey and Long Island, per 100, \$4@5; state, per 100, \$3.50@4.50.

Cucumbers—Shelter Island, per barrel, \$2@4; selected, per 100, 75c.@\$1; Florida, per crate, 40@75c.

Egg plants—Jersey, per barrel, 75c.@\$1.25; Jersey, per one-half-barrel box, 75c.

Green peas—Virginia, per basket, 75c.@\$1.25.

Lima beans—Jersey, Potato, per bag, \$1@1.50; Jersey, flat, per bag, 50@75c.

Onions—Orange Co., red, prime, per bag, \$1.50@2; Orange Co., yellow, per bag, \$1.50; Orange Co., white, per bag, \$1.50@3; Orange Co., inferior, per bag, \$1@1.25; state and West, yellow, per barrel, \$1@1.75; Shelter Island, yellow, per barrel, \$1.75@2; eastern, white, per barrel, \$2@3.50; eastern, red, per barrel, \$2.25; eastern, yellow, per barrel, \$2@2.25; small, white, per barrel, \$3@4.

Peppers—Jersey, red, per barrel, \$1@1.50; Jersey, green, per barrel, 75c.@1.

String beans—Virginia, per basket, 25@30c.

Squash—Hubbard, per barrel, 75c.@\$1; Marrow, per barrel, 75c.

Tomatoes—Per box 75c.@\$1.

Turnips—Russia Canada per barrel 75@85c.

Potatoes—Long Island, in bulk, per barrel, \$2.25; Jersey, per bag, bag included, \$2@2.12; choice round, in bulk, per barrel, \$2@2.12; fair to good, in bulk, per barrel, \$1.50@1.75; state, in bulk, per 180 pounds, \$1.87@2.12.

## Boston.

Seckle pears take a range of \$1.50@4 per bushel; readers must understand that it takes a handsome thing to bring \$4, and that there are not many of this kind. Choice Sheldons \$3 a bushel, while ordinary sells 75c.@\$1.50; Buerré Bosc, fancy, \$3; other grades downward according to their quality. Comice \$2; this pear is very little known in this city; it is called a nice pear, having a very little tart flavor, which pleases a good many tastes. Bartletts \$1.50@2.25, but occasionally a fancy box \$3; Kieffer pears limited demand, when customers can be found bring \$3@3.50 per barrel.

Lettuce is dull; in other words, there is plenty stock offering with very small head, while large heads are scarce, wanted, and in good demand.

Very few native peaches coming in; bring 50c.@\$1.25 per basket; the arrivals as well as the demand are of a limited nature.

Hothouse tomatoes higher and are being sold 10@15c. per pound.

Apples easier for all kinds of cooking stock. Ben Davis \$2.25@2.50 per barrel; Greenings, Baldwins, and Spies, \$2.25@2.50; high-colored Snobs, \$3@3.25; and the same price can be obtained for fancy Jonathans. A party in Maine sent up five barrels of triple extra Gravensteins which sold \$6 a barrel; it almost takes one's breath away in mentioning the fact.

Hothouse grapes fairly active; with a good demand at prices ranging 25@75c. a pound; partly on quality and partly on the customer.

In the pony baskets Delawares 11c., Niagaras 10c., Concord 7@8c.

Onions are a little easier, \$2 a barrel. Celery unchanged in prices as well as demand, 75c.@\$1.25 a dozen bunches.

Horticultural beans 50@75c. a bushel; Slevas and Limas, \$1@1.50; market very well supplied with these goods. Norfolk shipments of green string beans have been quite plenty the past week, but found no sale.

Cauliflower firmer, a range of price 10@18c. per head. Cabbage so plenty that 3@4c. is best range in price we can name.

Hothouse cucumbers not moving quite as freely as the ought, \$3@5 per 100 the ruling price. We might say right here that the trade the last five days has been what is termed in this city mighty dull. One of those times when it seems as if people ate nothing.

Cranberries are weaker, \$5@5.50 a barrel; crates \$1.50@1.75; peppers seem to be waiting for colder weather, so that they may warm up the partakers. No change in their selling prices. Nor can anything new be said regarding egg plants.

Carrots selling 50@75c. a bushel or \$1.50@2 a barrel. Some of the finest purple top turnips have come in and sold \$1.25 a barrel. They were ahead of any stock we have seen for several years. Beets are not in very large demand at 35@50c. a bushel; parsnips 75c. a bushel; not a great supply here, neither any large amount wanted; some corn offered 10@12c. a dozen.

Squash, while not in so healthy demand, can be quoted about the same, \$1@1.25 per barrel for Marrow, Hubbard, Turbans, or Bay State, \$1.50. Several cars of Minnesota hard-shelled Hubbard coming in at present time and brings \$25 per ton. Forty cents will buy a dozen bunches of mint. Parsley still continues 50c. a bushel.

Potatoes are lower, 65@70c. for best Hebrons; in small lots the jobbing price at railroad yards being 75c. for anything. Quite a good deal of the stock coming here from Minnesota has false hearts; therefore hard to place in New England. Our people know what a good potato is and will have it or none.

Sweet potatoes broke down a little; Eastern Shore stock bringing \$1.87½, while the Norfolk County growings being in large flour barrels bring \$2.

Quinces in liberal supply, 35c. in the peck baskets; or \$3.50@4 if in barrels.

A few plums still offered, but customers are scarce. Cantaloupes and watermelons are so little called for that it is unwise to mention them, except to let readers know they are still among us.

Florida continues to give us a few pineapples which sell anywhere from 8@10c. a piece.

## Philadelphia.

The general tone of the market has been much slower than last week. The supply of nearly all kinds of stock has been light, and buyers have been much more particular.

Receipts of apples have been moderate, and the demand for choice fruit has been good. Prices have been: Jonathan, per barrel, choice, hand-picked, \$3.25@3.50; Gravenstein, hand-picked, per barrel, \$3@3.25; Black Detroit, and Twenty-Ounce, choice, per barrel, \$2.75@3; mixed varieties, choice, per barrel, \$2.25@2.75; mixed varieties, fair, per barrel, \$1.75@2.

Pears—Bartlett, per barrel, \$3@4; per bushel keg, \$1@1.75; Seckle, per barrel, \$3@4 per one-half barrel, \$1.50@2; Louise Bonne, per barrel, \$1.50@2; per

half-barrel, 75c.@\$1; Duchess, per barrel, \$1.75@2.

Peaches are about done, and receipts have been small. Mountain fruit, per five-eighths basket, choice, \$1@1.50; fair to good, per five-eighths basket, 75@85c.; per 20-pound basket, 75@90c.; fair to good, 50@65c.

Grapes—The supply has fallen off considerably, and demand has been light; N. Y. Concord, per 5-pound basket 6@7c.; per 10-pound basket, 10@12c.; N. Y. Delaware, per 10-pound basket, 12@14c.; N. Y. Niagara, per 5-pound basket, 6@8c.

Cranberries—Cape Cod, per barrel, choice, \$4@5.50.

Quinces—No. 1, per barrel, \$2.50@3; No. 2, \$1.50@2.

Plums—Prunes, per 10-pound basket, 20@30c.; Gage and Reine Claude, per 10-pound basket, 18@25c.; Damsons, per 10-pound basket, 14@18c.

Cauliflowers—Choice, per barrel, \$1.50@2; fair, per barrel, \$1@1.25.

Celery—Choice, per dozen, 30@40c.; fair, per dozen, 15@25c. Corn, per 100, 60@90c.

Cabbages—Jersey, per 100, \$3.50@5.

Lima beans—Per 100 pounds, \$2@2.40.

Peppers—Per barrel, red, 75c.@\$1.25; green, per barrel, 50@65c.

Squash—Hubbard, per barrel, 70c.@\$1; Marrow, per barrel, 65@80c.

Green peas—Per bushel box, 65@75c.

Onions—Jersey, white, per barrel, \$2@2.25; yellow, per barrel, \$1.50@2; per bushel, 60@75c.

Potatoes—Receipts have been liberal, the market being somewhat easier, nearby stock shows poor keeping qualities, which will, no doubt, cause an advance. Sales have been slow, apparently only to supply immediate wants. Prices of choice stock per bushel, 70@75c.; fair to good, per bushel, 60@65c.; Jersey sweets, per five-eighths basket, 80@40c.

## SOME BARGAINS IN CLUBS

FOR

Men, Women and the Young.

**Ohio Farmer**, a giant among the agricultural weeklies, and American Gardening, The two, one year, For \$1.60.

**Farm, Field and Fireside**, a 32 to 40 page weekly Farm and Family Journal, the best of its class, and American Gardening, The two, one year, For \$1.50.

**Country Gentleman**. This weekly amply covers the field its title indicates. Every country gentleman should subscribe to it. And American Gardening. The two, one year, For \$2.75.

**Farm Journal**, the "little giant" of monthly journalism in matters agricultural, and American Gardening, The two, one year, For \$1.25.

**Farm Poultry** (semi-monthly). and American Gardening, The two, one year, For \$1.50.

**Poultry Monthly** and American Gardening, The two, one year, For \$1.25.

Above is your choice of two most excellent poultry magazines. And nearly every one of our readers keeps poultry. Why not subscribe to both? The two poultry papers and American Gardening, one year, For \$2.25.

**Meehan's Monthly**, a horticultural stand-by, and American Gardening, The two, one year, For \$2.85.

**Harper's Magazine**, as good as ever; none better among the literary monthlies, and American Gardening, The two, one year, For \$4.25.

**Ladies' Home Journal**, an unrivaled monthly for women, the standard in its class, and American Gardening, The two, one year, For \$1.90.

**Youth's Companion**, of Boston. At the head of all journals for both boys and girls, and read by the elders, too. New Subscribers Only and American Gardening, The two, one year, For \$2.35.

# OUR CLUB LIST

LET US FILL YOUR ORDERS FOR 1898.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

Address all Orders to

AMERICAN GARDENING, P. O. Box 1897, New York.

# Henry Strawberry Plant Premiums

Will be shipped to all who desire them this season until ground freezes.

Owing to the wonderful run on this unequalled strawberry we are preparing 100,000 Henry plants for Spring delivery, and in this connection we desire our readers to remember

## Two Facts

- 1—The Henry Strawberry can be obtained solely through a subscription to AMERICAN GARDENING; as the publishers will not sell plants under any consideration;
- 2—Neither will Mr. Jerolaman.

## Who is Entitled to Plants

**New and Renewal Subscribers.**—Five plants of the Henry will be mailed, postpaid, as a premium to every Renewal or New Subscriber sending us \$1.00 for a year's subscription. When remitting be sure to state if you want this premium.

**To Agents and Workers.**—For every \$1.00 received from agents and others for New Subscriptions, we mail, postpaid, Ten Henry plants, Five to the New Subscriber and Five to the Agent.

## Special to Club Raisers!

**Clubs of Ten.**—To every agent sending us in a club of Ten New Names and \$10.00, we will forward in payment therefor One Hundred (100) Henry Strawberry Plants, by express, as well as send Five plants, postpaid, to each person in the club.

Mr. Jerolaman's series of articles has been put in pamphlet form; and agents will be supplied with copies on application. Best campaign matter out.

Address Your Letters,

## A BARGAIN

We have made arrangements to furnish THE OHIO FARMER of Cleveland, O., and AMERICAN GARDENING, both papers, one year, making a total of 104 great papers, for only \$1.60.

ONLY \$1.60

## THE OHIO FARMER

is well known as one of the very best, largest, and in every way the most desirable weekly agricultural journal of this country. It is clearly the LEADER of the Agricultural Press of America. A 20-page, 80-column paper EVERY WEEK in the year; employs THE VERY BEST WRITERS that money can produce; a strong, fearless defender of the agricultural interest of this country, and CLEAR in both reading and advertising columns. IT HELPS MAKE THE FARM PAY. SAMPLE COPIES FREE. Present subscribers can order this combination at once and have their present term of subscription to AMERICAN GARDENING extended for one year. New subscribers to THE OHIO FARMER will receive the rest of this year free. Address all orders,

AMERICAN GARDENING, P. O. BOX 1697, NEW YORK.

## LORD & BURNHAM CO.,

Architects and Builders Steam and Hot Water Heating Engineers.

(Established 1856.)

Plans and construction embraced on application for Greenhouses, Conservatories, and all kinds of Horticultural structures, erected complete with our patent iron construction; or for material only, ready for erection.

Largest Builders of Greenhouse Structures. Plans and construction embrace latest improvements. Six highest awards at the World's Fair. . . . . Send four cents postage to New York office for latest catalogue. . . . .

## Treating Celery for Leaf Blight Disease.

The early part of July of this year, we set out about 400 lery plants in a rich, mellow bed of earth which had been previously used for Violets. The plants started off well, making fine growth, which remained healthy until the latter part July. At this time the entire bed was attacked by celery blight (*Cercospora apii*), and by August 14 every leaf, except every youngest, was diseased. At this time we decided to spraying with Bordeaux mixture and ammoniacal solution copper carbonate with a view of checking the spread of the disease. All badly affected leaves were first cut away, and the d, which contained 47 rows one foot apart, with 8 plants the row, was divided into three plats. Plat No. 1 contained

smaller and in most cases drawn and curled and of a much lighter color than those receiving Bordeaux mixture, besides showing considerable blight. The unsprayed plants blighted badly from the time they were cleaned up, when the spraying of the other plants commenced, until the close of the experiment.

The results obtained in this experiment are fairly shown in the accompanying photograph, made October 9, 1897. The first two plants were sprayed with Bordeaux mixture, the following two with ammoniacal solution, and the remaining two were left unsprayed. Before photographing, all the worst diseased leaves were removed, leaving the plants sprayed with Bordeaux mixture entirely free from blight, those unsprayed

I.—Treated with Bordeaux.

II.—Treated with Ammoniacal solution of Copper Carbonate.

III.—Untreated.

FIG. 203.—THE TREATMENT OF CELERY FOR LEAF BLIGHT DISEASE.

rows and 160 plants, which were to be sprayed once a week with Bordeaux mixture, the 50-gallon formula, i. e., 6 pounds copper sulphate, 4 pounds of lime, and 50 gallons of water. at No. 2, in the center of the bed, contained 7 rows and 56 plants, which were left untreated for control. Plat No. 3 contained 20 rows and 160 plants, which were to be sprayed with ammoniacal solution of copper carbonate, the 45-gallon formula. The sprayings were made once a week until the plants received five applications, water being regularly applied in the meantime by syringing overhead. The plants sprayed with Bordeaux mixture took on a deeper green than the others, and also made a much more vigorous growth than either the unsprayed plants or those sprayed with ammoniacal solution, and were, moreover, almost entirely free from blight. The plants sprayed with the ammoniacal solution seemed to be checked in growth, the foliage being

with ammoniacal solution with a few spotted leaflets here and there, and the unsprayed with infections on nearly every leaf except the very youngest. After being photographed the plants were all cut off at the surface of the ground and weighed, with the following results:

No. I, treated with Bordeaux mixture, weighed 29½ ounces. No. II, treated with ammoniacal solution, weighed 16 ounces. No. III, unsprayed, 9½ ounces.

As will be seen from these weights, as well as in the photograph, there is a marked difference in favor of the Bordeaux sprayed plants.

This experiment was a very severe test of the value of the fungicide, as prior to the treatment the disease had gained a firm foothold. The work has pretty thoroughly convinced the writer that the blight may be kept well in check by the use of Bordeaux mixture properly applied. P. H. DORSETT.

## Begonias and Gloxinias.

[Paper read by A. A. McDonald, before the Lenox, (Mass.) Horticultural Society, and officially communicated to AMERICAN GARDENING.]

Begonias and Gloxinias are two of the most interesting and useful greenhouse plants in cultivation. For the purposes of these remarks I will divide the Begonias into three classes, namely, Rex, Flowering, and Tuberous, dealing with each in its turn.

### Rex Begonias.

In this section there have been marvelous improvements during the last few years, and among the best are the following: Mdme. Siebold, President Carnot, Charles Laurent, Mrs. A. G. Sheppherd, Robert George, Louis Closson, Louise Erdody, Kaiser Wilhelm, Baron Prevost, Perle Hunnefeldt, and Marquis de Paralta.

To have them at their best the plants should be grown in pans, when they are invaluable for conservatory and greenhouse decoration. They can also be used with splendid effect in covering walls or other unsightly places in the greenhouse.

Cuttings made during the latter part of August make the best plants, although good plants can be had the same year by propagating early in February. I have found that it is better to leave the cuttings in the sand till they show signs of growth at the top.

In making cuttings choose leaves that are well-ripened, cut in parts from the midrib and insert in the sand one-half inch deep, give a thorough watering and keep the house closed for a few days; at the same time do not allow the temperature of the house to go over 80 degrees. This is the most important point in propagating Rex Begonias. I have seen more failure than success in propagation by not observing these details.

The plants will thrive in any good rich loam with plenty heat and moisture. They are subject to a rust which is induced by sudden changes in temperature and draught, wherefore the remedy suggests itself.

### Flowering Begonias.

In flowering Begonias we also have very useful plants for either commercial or private use. The old so-called "rubra" as an all-round plant is still at the head of this class; possibly because it will bear more abuse than any other. Those which are considered the best are rubra, Thurstonii, Saundersonii, argentea, guttata, picta venalis, metallica, rosea gigantea, sanguinea, incarnata, Gogensis, Mdme. Linet, and a fine new one Glorie de Paix; this latter requires stove treatment. They thrive best in a light rich soil in ordinary greenhouse temperature.

As these Begonias will not reproduce themselves from seed, the best way is to propagate them by cuttings, which may be done at any time during the winter or spring for good plants desired the same year.

### Fibrous Rooted Begonias.

Another interesting set of Begonias in this class is the fibrous rooted semperflorens varieties; these are chiefly used for bedding, and with good effect. It is a matter of opinion as to which is the better way to raise these, whether from seed or by cuttings, but for my part I believe the better way is to raise them annually from seed. By sowing in pans in a warm house during January or February and keeping growing, fine plants can be had by the middle of May.

### The Tuberous Begonias.

The most showy of all the Begonias are the tuberous. When well grown they make as fine a display as any plants I know of; their rich colors, large flowers and perfect form of growth commending them to all lovers of floriculture. They are of easy growth, but will not stand any forcing; under such treatment they rebel.

It seems reasonable to suppose that the real cause of the rust about which so much has been written, is principally too high a temperature; we hear men who are supposed to know, advocating grow-

ing in a high temperature as being the best means to eradicate the disease. For one, I will not accept this theory, in fact, I will guarantee by putting a badly infected plant into a cold frame to bring it out in a healthy condition. And anyone else can do the same.

The tubers are usually started into growth from February to May for a succession. I prefer starting them in pots as small as they can conveniently be placed in. Good rough loam, well-rotted manure, and a liberal supply of soot with some sand will insure a good healthy growth.

The greatest care should be exercised in watering, as they are very susceptible to over-watering. It will pay to look over them three or four times daily during bright weather. To grow the best of plants a hose should never be allowed near them. After they have been shifted for the last time liquid manure given occasionally will greatly benefit the plants. For shading, one-inch strips tacked onto wire netting three quarters of an inch apart answer first-rate. It can be removed at any time. Permanent shading is not conducive to a strong, healthy growth.

There are various methods of propagation, but the usual way is to raise from seed, which may be sown in pans or flats in a warm house with a light of glass placed over them, to prevent the soil moisture from evaporating too rapidly.

In watering the seedlings it is better to sub irrigate than to water overhead, as the soil is liable to crust and so prevent germination. As soon as the seedlings appear the light should be gradually removed till you think they are strong enough to do without it. They are usually pricked off in flats when strong enough and later potted on in light soil. Gloxinias.

Gloxinias are natives of tropical America and hence require stove treatment. Bulbs can be had at very reasonable figures, so that it is more satisfactory to buy them than to raise them from seed. They are usually started into growth from January to May. A few started at different periods will give a good succession and prolong their season. After the seedlings are well established (say about the middle of June) it will greatly increase the size of the bulbs to plant in a spent hotbed.

The compost should be very light, as anything like heavy stiff soil is fatal to the plants; one part leaf mold, one part peat, one part of old rotted sod, a little old manure, and enough sharp sand to keep it open will give good results. Pot in as small pots as the plants can conveniently be placed in, seeing that drainage is perfect, some charcoal among the crocks will be found beneficial. As soon as the roots appear next the pot, the plants should be shifted on successively till they come to the flowering pots. As soon as the leaves cover the pots they should be stood on others inverted under which saucers have been placed and these kept filled with water. Syringing among the pots three or four times daily will be about all the water they will then require. By this treatment there is very little danger of thrips appearing.

If this pest shows itself it should be overcome at once, as it will ruin the plants in a very short time. There is nothing looks more miserable than a Gloxinia infested with thrips. A few drops of ammonia dropped in the pathway will hold them in check, also tobacco in its various forms will answer.

A very important part in the cultivation of the Gloxinia is in properly ripening off the tubers after the season's growth. This should be carefully attended to, as much depends on this for the following year.

Gradually withhold water as the leaves begin to ripen, and never under any circumstances cut off any of the leaves, as the sap in them has to be taken up by the bulb to help in doing the work of the following year. The leaves will drop off themselves when sufficiently dried. A temperature of 50 to 55 degrees will be about right to store the bulbs in.

In raising from seed much the same treatment as recommended for tuberous Begonias will answer.

## The Fruit Garden.

The fruit exhibit at the American Institute Fair has at this date beaten past records for size and quality. Elhwanger & Barry, the Mount Hope nurseries, Rochester, N. Y., have an extra fine showing, in which, for size, were very prominent, Beurré d'Anjou, Beurré Calgaigne, and Angouleme pears, some 40 Anjous having a place of honor in the center of the table. For beauty just now, Buffum, Flemish Beauty, Lady Clapp, Sarah, and Jackson were very noticeable, the last having the appearance of Clapp's Favorite in shape and color of cheek with the russet dots of the Seckel.

Lady Clapp is a fine smooth-skinned yellow pear, very much after the style of Bartlett, but ripening the end of September, quality of fruit very good; tree good grower. Here could be seen some of the new varieties of the firm's seedlings as Col. Wilder, P. Barry, etc. Do not confound this last with Barry, one of the older pears of similar shape that ripens in October, whereas P. Barry is a late winter pear. One point about this exhibit was the care shown in selecting the specimens of each variety; it reminded me of the old quotation "as like as two peas in a pod." Another item was I saw no change or correction of names in the lot; in short, this whole exhibit gave the impression that these exhibitors had the stock, and knew their business from a to z.

Apples and Grapes are in great quantities and varieties from a number of exhibitors. The Eastern New York Horticultural Society was just getting a large collection in place. Among the grapes staged I noticed one of fine appearance named Mills, while here were Eaton and Niagara in better shape than shown in the Geneva exhibit. Nearby was a new grape Alice, exhibited by Ward D. Dun, of Clintondale, N. Y., who is willing to answer any questions concerning it, which, judging by the appearance of these, it would pay to do, if about to invest in new grapes. The exhibit showing some fine bunches of a red color, and a branch showing it to be very prolific. An exhibit of apples from Stephen Hoyt's Sons, New Canaan, Conn., was in this part of the hall.

An exhibit from California of grapes and dates was being unpacked, and others coming in which makes things look now as if next week New Yorkers will have a fruit show that they should appreciate.

The exhibition of nuts from John L. & W. Parry, N. J., is another very interesting feature and worthy of some thought and inquiries when we read of the quantity imported to this country every year. J. HOLLOWAY, Glen Cove.

### Raspberry Enquiries.

Last winter I bought a few small raspberry plants; they were set out in good soil, an old cow pen. Cutbert and Schaeffer both bore a few fine berries. The wood then seemed like dying, as new shoots were coming. I cut all the old wood out. Was that right? Now, September 12th, there is plenty of new canes ten feet long. I have them trained on frames. I am now afraid that I have not managed them right; think perhaps they should have been kept pinched back to make them grow in bush form. It is said that raspberries do not do well in Louisiana, but a few years ago I had red raspberries sent me from Missouri. They thrived in spring and again in fall. A man fairly tore them from the ground and lost them.—C., La.

—The treatment was all right, only it is probable that if the growth had been stopped once, more fruit would have been obtained next summer from the resulting three or four canes than from the one extra strong cane. Don't cut the canes back, but bend them so that the tips touch the ground; it will make the canes produce fruit-bearing shoots on a larger portion of the canes.

## Questions Answered.

Our Inquiry Department is a Bureau of Information, to which subscribers can apply freely for advice on all subjects in the field of horticulture.

\*. We cannot undertake to reply by mail.

### Clematis Dying.

What is the cause of Clematis dying off just above ground when the plant is in full bloom. The stem turns black and in a few days is dried right off: it seems to me to be a disease. Can you inform me of a remedy, as I have lost numbers of them the last two years, and had no trouble before.—A. ANNANDALE.

—This is a matter of much mystery, and was discussed in these columns very recently (July 10, 17, 24, and 31), but no definite conclusion was reached. Several expert growers are at work trying to discover the cause of the trouble, it having occurred simultaneously in parts far removed. As soon as possible any advance of knowledge will be published in these pages.

### Increasing Stock of Strawberries.

I am at a loss to know just what is the best thing to do. We want to increase our stock of strawberry plants during the winter. We have a Rose house and also a house for Carnations. Which temperature will suit the strawberry the better, also should they be potted or planted in the bench?—J. W. M.

—The Carnation house comes nearest to what the strawberry needs in the way of temperature; the Rose house would be altogether too warm. The plants would do better planted out than in pots. But it is a very questionable proceeding to attempt to propagate stock in such a manner. It certainly must weaken the constitution and would give a severe setback to the young stock.

### Scale on Shade Trees.

(To T. Price.)—Do not, by any means, cut back the Silver Maples because they have insects on them—already too many valuable trees have been thus destroyed, and with modern appliances for fighting insect pests, such treatment shows only ignorance. If you send specimens of the insects we shall be able to give definite advice as to treatment, not otherwise.

### Peaches for Long Island.

What three varieties of peaches would you recommend for the light sandy soil of Long Island? The trees now on the place are doing remarkably well. I wish to grow the fruit for the New York market.—J. McH.

—Long Island growers are not able to compete in the markets with early varieties, so that late sorts only are recommended. The following are already found doing well in this section named: Elberta, Rives' Favorite, Fox Seedling, and Crawford's Late.

### Wintering Tender Stock.

How do florists carry through the winter stock of tender plants, as for instance, Coleus?—C. C. M., Conn.

—Cuttings are taken early in the fall and established as plants; in this way they continue to grow during winter. Old stock plants are also kept over, and propagation begins in January. It is then easy to propagate from the young struck plants, tips being taken as soon as they become available.

### Hardiness of English Violet.

Will hardly English Violet, if transplanted in the open ground in November, survive the winter?—C. S.

—Possibly it will do all right, but it is safer and wiser to give some sort of protection.

### Roses in Winter.

Do Roses of the American Beauty, Kaiserin Augusta, Bride, Maman Cochet class require protection on Long Island? If so, please explain method.—C. S.

—American Beauty may survive the winter outdoors in the section named, but for all that it can hardly rank as a

suitable Rose for such a purpose. Kaiserin Augusta makes an excellent outdoor variety, easily one of the best. Maman Cochet will also do tolerably well. A few dry leaves or a little litter is all that is needed for protection. Mulch the ground so that the collar of the plant is protected, that is, the vital part, usually two inches is sufficient.

### Woolen Waste as Fertilizer.

Has the refuse of a woolen mill much value as fertilizer? Is it good to mix it with stable manure and let it rot during the winter? How to apply it as fertilizer alone? For what farm crops and vegetables?—W., Mass.

—The average of eleven analyses of wool waste reported by the Massachusetts Experiment Station is: Nitrogen, 4.56 per cent.; potash, 1.68 per cent.; total phosphoric acid, 0.31 per cent. Its

FIG. 204.—LAYING DOWN BERRY CANES.

commercial value as a fertilizer calculated from this is about \$15 per ton. However, the plant food in it is but slowly available, and \$10 would probably be the highest value that should be assigned to it. Mixing with stable manure and allowing it to rot would increase the solubility of the plant food, but the large amount of nitrogen in the waste would necessitate careful handling to prevent loss. The addition of 200 pounds of gypsum per ton of waste would largely prevent escape of ammonia. It would scarcely be profitable to apply the waste alone. The addition of 100 pounds of acid phosphate and 10 pounds muriate of potash to each 100 pounds of wool waste would give a fertilizer containing

FIG. 205.—A CONVENIENT DRIVEWAY.

about 2.25 per cent. nitrogen, 3.35 per cent. potash, and 6 per cent. available phosphoric acid. If used alone, the waste should be worked into the soil before the planting of the crop, to give time for decomposition. It would act too slowly to be of great value as a fertilizer for vegetables; it might be used on corn, wheat, and grass lands with profit.—JOHN FIELDS.

### Insects Eating Shrubbery Foliage.

The specimens of worms sent from Avondale, O., were dead and so badly mutilated that it is impossible to determine definitely what they are; possibly the species of Leaf-roller, known as the "Fruit-tree Leaf-roller" (*Cacocla argyospila*). This is known to feed upon various kinds of shrubbery and upon fruit trees. Paris green used at the rate of one pound to 160 to 200 gallons of water has been found to be the best remedy for

the above pest, but I would recommend that the Paris green be used with Bordeaux mixture, instead of with water alone. The Bordeaux mixture will adhere to the leaves better than water, and when dry is not washed from the foliage by the first rain that falls. It also has the advantage of counteracting the tendency of the Paris green to burn the foliage. If London purple can be purchased more cheaply than Paris green it can be safely used with Bordeaux mixture.—F. A. SIBBINE.

### Propagation of Clematis and Pelargoniums.

(To F. C.)—A full account of the methods of propagation of Clematis will be found in the issue of July 10, page 493. Pelargoniums are treated upon at length on page 271 of the issue for July 27, 1895.

### Grafting Apple on Pear.

Is it possible to graft pear on apple (or vice versa) and have the two kinds of fruit on the same tree?—INQUIRER.

—While it is possible, it certainly is not desirable. It is more practicable to adhere to the usual practice of growing each as a separate tree.

### Mushroom Spawn.

If mushroom spawn is put under sod in lawn now (October) will it bear next summer? Please give directions for treatment of mushrooms.—M. W., N. J.

—The life of spawn when inserted artificially under grass is always uncertain; it may live or it may not. Make your request on mushroom culture more specific.

### Laying Down Canes.

In some sections the only hope of the next year's raspberry or blackberry crop depends on the laying down and covering of the canes late in the fall. Laying down blackberry canes by hand is a weariness (and a laceration) to the flesh. The cut shows a device that does away with such hard work. A short log is hollowed out in the form shown, and strips added so that it can be drawn along the row over the canes. Unless the log be large, or of hard wood, more weight may be needed. In which case rocks can be added as shown. As the canes are bent down they are covered with earth from behind, and the roller goes on to the next hill.—D.

### Driveway for Village or Farm Lawn.

The proper laying out of the driveway into one's grounds is a matter of not a little importance, for a mistake made in this, entails inconvenience for almost every day thereafter. One of the most serious inconveniences in the case of most driveways, is the necessity for one driving in, to turn his wagon or carriage about by cramping the wheel and backing (often in a contracted space), before he can get out again. A driveway ought to have a circular or oval turn, so that the butcher, the baker, and the candlestick-maker—as well as those who call socially, may be able to drive into one's ground—without having painful doubts as to ever getting out again! The accompanying illustration gives a plan for laying out a turn at the side of the house that will prove both convenient and attractive, if the circular space inside the drive is attractively set out with plants and shrubs. This drive gives a straight run into the stable, or gives a chance for an easy turn to those who wish to go out. Of course all houses and stables do not have this relative position that is given, though a large percentage have.

However, the same idea can be adapted to almost any situation, without necessarily sacrificing either convenience or attractiveness.—WEBB DONNELL.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

### A Fertilizer Problem.

A correspondent recently sent us a cutting from a contemporary publication and remarks as follows:

"The enclosed clipping I send you from where it is published without note or comment, as if the editor accepted its statements as trustworthy. What does AMERICAN GARDENING say about it? Would such a mixture save our strawberry beds from the ravages of the grub that are often so destructive? Has any one tried it besides Mr. Ward?"—W. H. W.

The clipping referred to we have noticed in several other papers and is here given:

#### MANURE FOR ORCHARDS.

The following mixture, containing nitrogen, phosphoric acid and soda, has proved destructive to all grubs and worms that either live in the ground or go into it in order to pass through the pupa state, and come out as full-fledged flies to work their devastation on fruit and foliage, and there to lay their eggs for the perpetuation of their kind.

Slake 500 pounds of quick lime and mix 300 pounds of common salt with it. Let it stand for twenty days for chemical changes. It should be shoveled over three or four times to be thoroughly mixed. Then mix with it 300 pounds of powdered lime and 100 pounds of nitrate of soda.

The mass is then ready for use and will cost about \$8. Use 1000 pounds of this mixture per acre; spread broadcast on the orchard; it can also be used on lawn, meadow or pasture in the same quantity. The use of this mixture not only increases the quantity of the fruit, but also gives the fruit a better flavor, a higher quality and larger size and puts the tree in vigorous condition for future yields. The ingredients can be easily procured in any quantity at market prices, and the mixing can be done on the farm. It does not deteriorate in quality by keeping.

—The action of the separate ingredients which go to make up the above mixture is well-known.

Lime (quick-lime or caustic lime) has the property of making a small amount of insoluble plant-food available, of neutralizing (or sweetening) acid (or sour) soils, or rendering stiff clayey soils more easily worked, and in exceptional cases, of supplying lime to crops grown on soils that are deficient in this ingredient. Such soils are exceptions, and it seldom is necessary to apply lime as a direct plant food.

Salt (common salt, sodium chloride, or muriate of soda) is so well known that a description of its properties would seem to be superfluous. Yet frequently a new prophet arises and profoundly states that soda may replace potash as plant food, cheerfully disregarding the numerous careful experiments that have shown exactly the opposite. A few plants do well on soils that contain a large amount of salt; the majority do not thrive when any appreciable amount of it is present.

Nitrate of soda (sodium nitrate, or Chili saltpetre) is a valuable fertilizer supplying plant food in a readily utilized form; the nitrogen which it contains is the measure of its value. It will cause a vigorous growth of the foliage parts of plants and delay the production of flowers and fruit.

With these facts as a basis, we are prepared to understandingly tackle the wonder-working formula given above.

1. The mixture as stated does not contain phosphoric acid; the fact of its containing soda is of no special significance since it is not a plant food.

2. Very little chemical reaction other than the slaking of the lime and the formation of a small amount of carbonate of soda will take place when "500 pounds of quick-lime" are shoveled over three or four times to mix it with "300 pounds of common salt." Any reaction which can possibly take place will not produce a mixture giving effects dissimilar to those produced by the two ingredients applied separately.

3. The final mixing with "300 pounds of powdered lime and 100 pounds of nitrate of soda" is of no significance beyond the work involved. The addition of lime to nitrate of soda can neither injure nor benefit it as a manure.

So much for the fertilizing side of the case; any improvement of the quality, quantity, size, and flavor of the fruit is due to the action of the separate ingredients. The same may be said of its grub-killing properties. It is claimed by some, and with a good show of reason, that quick lime when applied to a soil in large amounts may kill some grubs and worms. Fertilizers containing salt have been recommended as of value in destroying grubs and worms in the soil, but experiments at the Cornell Experiment Station show that they are not always successful.

The action of the mixture advised would probably be similar; I have not tried it; it may be destructive to "all grubs and worms" that abide in the soil, but I doubt it. It is neither probable nor reasonable that it will.—JOHN FIELDS.

### Roses Under Glass.

During late Summer and early Fall we have been firing and ventilating more for the purpose of keeping out dampness than maintaining a given temperature; but it is now time that we turn our attention to the latter, especially at night. A rose naturally is a deciduous plant, therefore, we must be careful that it is not subjected to conditions that will cause it to go into a semi-dormant state, namely, too low a temperature, too much air, and keeping the plants on the dry side at the root for any unreasonable length of time. I have seen roses about this time of the year, that were perfectly healthy in every respect, still they kept losing too many leaves at the bottom of the plant and otherwise had a decided Autumnal look. La France is the most sensitive variety I know of in this respect. I always run a little higher night temperature during this period, not lower than 60 degrees, and a trifle warmer according to the mildness of the weather. I am well aware finer flowers can be produced in a cooler temperature, but in my experience I have not found it consistent with the growth we are looking for. If our plants stop growing now they will keep in that condition a long time.

In regard to firing and ventilating, it will be found necessary on cold days not to drop the steam too early in the morning, even if it promises to be bright and warm. The day is pretty well along before the sun begins to warm up the houses, and therefore it is best to keep up some heat to help the day along. We always have a pile of wood in the cellars, and if a fire is nearly burned down by morning, we find it much better to put on a little fire to keep up the steam for such a short time, than to put on a new hard coal fire. Of course, where soft coal is used the wood would not be needed.

As to ventilating at night I always close up tight if there is frost in the air, and during daytime, especially if there is a cold air, I am very careful about the amount of ventilation, at the same time putting it on little by little as the day advances, and reducing it likewise in the afternoon. By so doing we get all the benefit from the sun possible. It often happens on bright days the outside temperature stands about 50 degrees. During such times it is a very easy matter for a man accustomed to rose growing, when walking through the houses, although the sun is warm, to feel a chilly atmosphere if too much air is on. When using more artificial heat care must be taken that the bottom of the benches do not become dry. They should be examined thoroughly.

### Celery Diseased.

(To C. H. B.)—Your celery is affected by the common celery blight due to a fungus *Cercospora apii* (see page 725).

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

### Hydrocyanic Acid for Fumigating

In our issue of September 4, Mr. Thomas L. Cone, in referring to a short previous note in the paper, asks for more information about the use of hydrocyanic acid gas. The method of using it was fully described in the Florists' Exchange of February 13, 1897, which article, by request of the Department of Agriculture is now reproduced. The gas was tried on a number of plants, but it has not been used commercially except on Violets, Davallia Mooreana, Adiantum cuneatum, and upon Coleus of various varieties. We think, writes Mr. A. F. Woods, acting chief of the Division of Vegetable Physiology and Pathology, the article referred to will give Mr. Cone such information as he desires. If not, we shall be glad to answer further.

"In the course of work on the fungus diseases of greenhouse plants we have been forced to take notice of a number of insect pests, which if left alone or destroyed by some of the usual methods proposed would seriously interfere with the progress of the main work in hand. Tobacco, for instance, in any form is not always safe for some crops, as under certain conditions it may render the plants more susceptible to disease.

"With a view of finding an effectual means of destroying some of the more common insect pests, especially aphides, hydrocyanic acid gas has been used under the direction of Mr. Albert F. Woods, on a sufficient scale to show its entire practicability, at least in the case of Violets. We recently called attention to this matter, and have received a number of requests for more details as to the methods employed in calculating the space in greenhouses, amounts of materials to use, etc. For the benefit of those making the inquiries, we take this opportunity of answering the questions as far as we are able.

"Figures 206 and 207 show cross sections of the two styles of greenhouse structures now in general use. The house shown in figure 206 is an even span, 75 feet long, 9 feet 6 inches wide, 10 inches on the sides, and 4 feet 2 inches from the beds to the ridge, with a walk 20 inches wide and 2 feet 10 inches deep. Now it is desired to determine accurately the number of cubic feet of space in this house, and to do this draw lines from the ridge and gutter plates, as shown in the sketch, and mark the respective lengths in feet and inches on each. The space is now divided into triangles and rectangles, and from these the cubic contents of the house may be computed. For example, the number of cubic feet in the walk (figure 206) is found by multiplying the depth, 34 inches, by the width, 20 inches, and then by the length, 75 feet, or 900 inches, and dividing the product by 1,728, the number of cubic inches in 1 cubic foot, as follows:  $34 \times 20 \times 900 \div 1,728 = 354.16$  cubic feet. Second, to find the number of cubic feet in the space between the bed and gutter plate, multiply 9 feet 6 inches by 10 inches, then by 75 feet, and finally divide by 1,728, which will give 598.75 cubic feet. It will, of course, be understood that in making this calculation the feet must all be first reduced to inches.

The rule generally given to find the area of a triangle is to multiply the perpendicular by the base and divide the product by 2. The quotient will be the area of the triangle. Thus, to find the contents of the space abc, multiply by bc by ac and divide the product by 2, as follows:  $57 \text{ inches} \times 40 \text{ inches} \div 2, \times 900 \text{ inches, or } 75 \text{ feet, equals } 102,600 \text{ cubic inches, divided by } 1,728 \text{ cubic inches equals } 593.75$ , the number of cubic feet in the house space abc. Since the two triangles are equal the contents of one multiplied by 2 will give the total number of cubic feet contained in the roof. Thus,  $598.75 \text{ cubic feet, multiplied by } 2 \text{ equals } 1,197.5 \text{ cubic feet. We therefore have in the house of the dimensions given as follows: } 354.16 \text{ cubic feet} + 593.75 + 1,197.5 = 2,145.41 \text{ cubic feet.}$

"For fumigating Violets use 0.15 gram of potassium cyanide per cubic foot. Thus a house, as shown in figure 206 would require  $2,145.41 \times .15 = 321.8115$  grams. To reduce this to ounces divide by 28.35, the number of grams in an ounce. This will give 11.29 ounces, the

amount of potassium cyanide required. For every part of cyanide use  $1\frac{1}{2}$  parts of commercial sulphuric acid and 1 part water. That is, where 11.29 ounces of cyanide are used, it would require 16.93 ounces by weight of sulphuric acid, and 11.29 ounces of water.

"At figure 207 is shown a section of a different style of house, the cubic contents of which may be determined as in the preceding case. This house is a  $\frac{3}{4}$ -span, 50 feet long, 18 feet wide, front wall 5 feet, back wall 7 feet, and 12 feet to the ridge. It will thus be seen that the size of a house of any given shape or style can be figured out, and the amounts of materials necessary to fumigate it ascertained.

"After determining the number of cubic feet the house contains, and the amounts of materials necessary to make the fumigation, arrange the ventilators so that they can be easily and quickly opened from the outside. This is absolutely necessary, as the house should be thoroughly ventilated as soon as possible after exposing the plants to the gas the desired length of time, and it would be almost certain death to enter the house to open ventilators. All having been arranged, look over the house and stop all large cracks through which the gas might escape. It will also be well to wet down the roof from the outside. The water will fill the cracks between the glass and make it nearly air-tight.

"Everything being in readiness, get a  $1\frac{1}{2}$  or a 2-gallon earthen jar, of as small a diameter as possible, so that when the acid and water are added, the potassium cyanide will be covered. Place the jar about the center of the house, provided the latter is not over 75 or 100 feet long. If longer than this, it will be best to use two jars, placed in the walks about an equal distance from each end of the house. Tack a small stick or lath across the walk to the edges of the beds, directly over the jar. If, however, the sides of the walk are not of sufficient height to allow the bag to hang above the jar, tack a piece of board to each side of the walk, and the lath across these, as shown in figure 208. Run a string from the jar over this stick to the door, and fasten one end

into the jar. Then pour in the required amount of water and add the acid slowly. When the acid is all added, a considerable amount of steam should arise from the jar, showing that the water is quite hot. If, however, this does not occur when all the acid is added, enough more should be poured in to cause the desired evolution of steam. After this, carefully place the string and bag in position, taking care that the bag does not fall into the jar before reaching the door. If, however, it should fall, hold your breath and make a rush for the door, for it will mean death to breathe the gas.

SHOWING METHOD OF CALCULATING SPACE.

Fig. 207.—Three-quarter Span House.

green and black aphids on Violets. One fumigation was sufficient to thoroughly eradicate the pests from badly infested plants, and, what is just as important, the houses one hour after the work was done were as sweet as if they had been exposed to fresh air."

## The Vegetable Garden.

**Endive.**—This will do well in cold frames if protected from frost. Dig up with good roots before hard frost and transfer to cold frames, and if treated similarly to lettuce will come in useful for garnishing, and is also fine for salad. If required to be blanched, keep partially shaded.

**Whitloof and Chicory.**—The thick roots of these should now be dug up and stored away in a pit or cool cellar covered with sand. Whitloof is very fine for salad during the winter months if properly grown. This can easily be done by placing in heat a few roots every few weeks. An ordinary mushroom house is peculiarly adapted to its requirements; it will grow to perfection there, but any corner will suit it where the temperature will average 50 degrees. For convenience it is best planted in a wooden box, this should be about 14 inches in depth, plant in rows about three inches apart in the bottom of the box, leaving a space in the top of box of about six inches; after the plants are set, procure any old boards, the same length as the rows, and set one on edge between each row, then fill to the top with good clean sand. In a few weeks the roots will be fit for use. When ready, and it is necessary to cut some, to prevent any damage, it is best to take out the end board; the sand will then fall out, and it can then be conveniently gathered. The object of the other boards between the rows is to keep intact those not required, as there should be no disturbance until the roots are required for use. This method is easy and convenient in handling, and whitloof grown thus makes a fine stiff growth, perfectly blanched, and is a very delicious salad.

**Mint** is very useful at times during the winter, and being so easy to grow should always be had when called for. Dig a few roots of this before the ground freezes, plant in heat, in hotbed or greenhouse, or it may be put in a pot and grown in any ordinary window.

**Chives** are also useful for salads; a bunch put in a pot in the fall and grown as directed for mint, will give constant supply for a long time.

**Parsley** should now be put into the greenhouse or hotbed, or it also can be grown in a pot in a window.

W. M. EDWARDS, Conn.

FIG. 208.—VIOLET HOUSE READY FOR FUMIGATING.  
Showing Arrangement of Jar, String, and Bag of Potassium Cyanide.

of it there where it can be easily reached. Procure a small paper bag (two-pound bag), large enough to hold the potassium cyanide. After placing the cyanide in the bag, tie it to the end of the string at the jar, so that it will be suspended over the lath and just above the jar, as shown in figure 208. In this way when the string is loosened at the door, the bag and contents will sink into the jar. After this is properly arranged, move the bag of potassium cyanide fastened to the string to one side, so that it will be out of the way when putting the other materials

quickly, first on account of its increased diffusibility, due to a rise of temperature, and second, because the plant has its stomata, or breathing pores open, and is taking in the gases of the air in order to make sugar. It is quite possible that if the temperature were low and assimilation could be stopped this gas could be used in daytime. It is decomposed by light, but it appears from experiments so far that the gas resulting is probably more effective in killing insects and not so dangerous to plants. However, additional experiments will be necessary

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 18, 1894.

PUBLISHED BY

A. T. DELAMARE PTG. & PUB. CO. LTD.

ROSE AND DUANE STS.,

RHINELANDER BUILDING, NEW YORK.

Telephone, 2154 Cortlandt. P. O. Box 1897.

REGISTERED CABLE ADDRESS

Commercial Cable) Florex, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to creditsame.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1897, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

## The Henry Strawberry.

Arrangements have been made whereby a bountiful supply of these plants will be ready for spring delivery to subscribers and agents, and in this connection we beg to call the attention of our readers to our generous offer of these plants in another column. We do not think that a more liberal offer has ever been made than the one now advertised, whereby the agent or worker sending us in a club of ten new names, at \$1 each, becomes entitled to 100 Henry Strawberry plants, while five plants will be sent postpaid to each person in his club. This offer will not apply to a club of less than ten. It may be a very long time before such an offer of such a plant can be made again. The wonderful success which has accompanied our premium offer this fall, in the short time at our disposal to advertise it, leads us to believe that the orders for the Henry Strawberry next spring may exceed all anticipations; however, we have planned for a large supply for delivery and trust to be able to meet all demands upon us. Mr. Jerolaman's series of articles is now being placed in pamphlet form, and copies will be mailed free to all who desire to use same in the canvas for new subscriptions.

All the premium Henry Strawberry plants due to date, have been shipped, except where a request has been made to hold them till spring, and judging by the unsolicited acknowledgments received, they are giving immense satisfaction. In order to reduce weight and hinder excessive transpiration some of the leaves are cut off before shipping, this is especially beneficial during a hot spell, and readers can rest assured all is done for the best.

## The Manure Question.

THIS is one of the most serious the horticulturist has to consider, because of the many phases that present themselves. In the first place we are to consider the cost, upon which its use is or is not practicable; and with this query is coupled the more important one, what special form is best for the soil upon which it is to be applied, and for the crops we are to produce.

One thing is as certain as the earth we tread, viz., without plant food we cannot have plants, and, to a limited extent the latter is proportionate to the former; nothing for nothing being the universal law of nature.

The agricultural chemists have given us the chemical properties of the plant, the food it requires, and have shown us where to find it, but they have not been able to furnish a chef who can prepare the food just as the plant desires it; they have brought "water to the horse, but could not make him drink." The owners of the clay, the loam, and the sandy soils have heard the story alike, when, in reality, it was told differently to each of them.

Different soils require different treatment, or, in other words, the fertilizers that one may require, would not be needed by the other. One soil may be deficient in lime, another in potash, while the third may be thirsting for nitrogen, and for special purposes every one must determine for himself according to his own situation and circumstances what the needs of his soil are, for the crops he is to produce.

It is generally supposed the barnyard furnishes the best plant food, and at the least cost. This may or may not be true, all depends upon the crops to be grown; if such only are grown as desire a free supply of nitrogenous matter it will do, but plants must have certain mineral substances, some of which seem necessary to both as stimulants or condiments, and which act upon and with the food in fitting it for use. Soil fertility will become impaired by the constant use of stable manure, where cultivated crops are steadily grown; and the same is true with chemical fertilizers, which impoverish the soil by not keeping up the balance of humus. The stable manure does not furnish the minerals, and the chemical fertilizers do not furnish the humus required for the plants. Consequently with a more than liberal application of either the soil does not yield as abundantly as it would do if given the kind of food the plants require, and as they want it. It therefore follows that the two kinds must be used together in order to get the best results.

The question is asked us "Can you suggest any preparation of stable manure so that it may be used in large quantities without danger of breeding maggots, wire worms, and cut worms." Insects are found in the greatest abundance in decaying animal or vegetable matter; their mission being to consume such; besides that, while fermentation is the most active, the reproduction is the more rapid, the heat being favorable to the hatching of the eggs, and the development of the larvae, these will always be present where there is manure, but they will be far less numerous where the manure is thoroughly rotted before it is applied to the soil.

The insect question has many sides to it. The majority of insects do not come because of the manure applied, but because of the crops that are to be grown. Every vegetable has its insect enemy, or, we might say, every insect has its favorite vegetable, and subsists upon that one alone. The brassica has its caterpillar, the asparagus its beetle, the onion its maggot, the squash and potato their own bugs. When any insect finds its feeding ground it will immediately establish a colony in anticipation of a returning crop the coming season, should the progeny find it, they will not only destroy, but again deposit their eggs from which the larvae will develop for the destruction of yet another crop. To thwart their purposes a rotation of crops will become necessary; and, in most instances this will prove an effectual remedy.

THE work just commenced in New York City of taking old burial grounds which are no longer used as such, and turning them into park areas is one of the most sensible steps of modern city government. In London, England, there is a special association which at its own expense undertakes to do this noble work, and the area of city lungs which has been thus made available is enormous. The conditions of our cities are not generally so extreme as are those in the older European countries. Yet in time, if precautions be not taken, our status will be what theirs is to-day. Even now New York City has the very uneenviable distinction of containing the most densely populated city area in the world.

This overcrowding is a serious menace to the moral, social, and physical welfare of our fellow-citizens, and calls for measures of relief in whatever way possible. The question opens a large field for discussion into which it is not our province to enter, but in one phase it has a bearing on the interests we represent. The multiplication of city park areas is a growing necessity and it is surely not a deprecation to devote to the welfare of the living what has already outlived its usefulness for the dead.

## A Fraud on Farmers.

A fraud order has been issued by the Post Office Department against Carl B. Cline, who operated a swindle from Columbus, O. Cline wrote letters to and inserted advertisements in various newspapers concerning a new wheat called the Early Surprise. He offered to send, on receipt of three stamps, a sample package of the wheat; in other letters he tried to get a notice for Crimson Clover, also offering a small sample for a few cents. Letters poured in on him by the hundred, and in return he sent a circular letter, saying that he would furnish the seed wheat at \$1.50 per bushel, and also quoted rates on Crimson Clover, and a certain brand of corn known as Ok. When the victims forwarded their money he failed to furnish the seed. Finally, the pressure became so strong that he went to a farmer near Columbus and bought 250 bushels of wheat from him, which he made up in small packages and sent to the victims of his game. He is now under bonds to answer a charge of swindling.

By the death of Charles A. Dana, editor of the New York Sun, American horticulture loses one of its most intelligent patrons. In our next issue we hope to give some account of his connection with gardening and shall present a splendid half-tone portrait from the latest picture taken by his son.

## Legal Notes.

**Plants Destroyed by Escaping Gas.**—An action brought by William H. Siebrecht against the East River Gas Company, in which judgment recovered on the trial by the plaintiff was on October 6 affirmed by the Second Appellate Division (New York), presents some singular features. The plaintiff, a florist owning greenhouses in Long Island City, claimed damages because the Gas Company allowed a pipe laid in the ground near his premises to become out of repair, so that gas escaped and destroyed his flowers and plants. The pipe ran along the tracks of an electric railway. The ground, in the winter, was frozen to quite a depth, so that the escaping gas was prevented by the frozen crust from reaching the surface, and in consequence percolated through the soil, and entered the greenhouses. It was claimed for the company that the life of the pipe, according to experts, had not expired, and that its condition was produced by the action of the electrical current from the railroad. Having remedied the defect as soon as possible, it claimed not to have been guilty of negligence.

Justice Hatch, who gave the unanimous opinion of the court, said in concluding his opinion, "that the condition of the pipe was produced from lying in a wet place. The character of the place should have been known, for the defendant made the excavation and laid the pipe therein. This evidence is more than a scintilla; it had substance in it, and the jury were authorized to predicate negligence of the defendant for a failure to examine the pipe under such circumstances. 'The evidence was clearly sufficient to exonerate the plaintiff from contributory negligence, and this question requires no discussion at our hands.'"

**Concerning a Cranberry Bog.**—One of the most important cases argued in the Supreme Court of Wisconsin was that of Russell Case, plaintiff, vs. Frederick J. Hoffman and others, defendants, argued recently. In 1873 the plaintiff bought about 400 acres of land in the town of Sullivan, Jackson County, for the purpose of cranberry culture. The land, as he determined at the time of the purchase, was well supplied with water from a lake known as Big Lake, about two miles northwest of the land in question. From Big Lake to and across the plaintiff's land, the water flowed upon the surface and beneath the surface. Through the greater portion of the distance between Big Lake and the plaintiff's land it was not confined within any channel. Beyond the plaintiff's land it again formed into a channel and emptied into a stream called Beaver creek. As it is impossible to cultivate cranberries without a supply of living water, the natural water supply to plaintiff's land was a matter of greatest importance, and relying upon its permanent character, he expended large amounts of money improving his cranberry marsh.

Later, under an act of the Legislature, a canal was constructed absorbing the water supply, and this finally came into the hands of the defendants, who refused to supply the plaintiff. The court gave judgment for the plaintiff for damages and an injunction commanding the defendants to restore the water to him. From this judgment the defendants appealed. The case was argued in the supreme court by R. M. La Follette and C. E. Roe for plaintiff, and Bushnell, Rogers & Hall for the defendants. The presentation of the case in the supreme court occupied nearly two days and the examination of the law and facts necessary to reach a decision in the case has entailed a very large amount of work upon the supreme court. The supreme court reverses the decision of the lower court, Chief Justice Cassoday and Justice Marshall dissenting.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

## Strawberry Culture for October.

October is rather an "off" month in strawberry culture proper, and although it pays to stir the soil shallowly after every packing rain till freezing weather, few continue it as late as October. Still no truce must be given weeds and grass to mature seed and make toil for the coming year. If not done earlier, it will pay to chop in around the plants 200 to 300 pounds of the fertilizer, mentioned later.

Except in the farthest north, October is usually the time for fall planting. A September-set plant is better, provided rain follows and puts it at once to growing. But nothing is as damaging to a strawberry plant as to be checked by drought soon after it is put into the ground. It is slow to recover from a check of this kind, especially in autumn. And September is all too apt to give it just such a check. In October, even if the soil is not more moist, it is cooler, and the sun is weaker, just the conditions that the strawberry loves. Plants set then are not apt to wilt, even without rain.

October-set plants undoubtedly bloom earlier and bear larger berries than those set earlier. They are often a week ahead of plants set in the spring or summer before. If the plants are vigorous and the soil rich and well prepared a fair crop of exceedingly fine berries will be the result the following spring. In the far south fall-set plants bear their main crop the following spring. Then the plants start the summer large and stocky, and will make a better growth and bear a heavier crop the next spring than if they had been planted only the spring before instead of the fall preceding that spring.

More care should be taken with fall-set plants, so they may get all the growth possible before cold weather comes. Well started, they continue their growth all through the winter wherever the temperature in the sun goes a little above freezing.

If the roots of the plants are very long, trim them back to about four inches. Let the hole in which they are set be large enough to spread the roots as near fan-shape as possible. Press fine, moist dirt firmly about the roots, letting it cover the roots firmly up to the bud, but no higher. Nothing checks growth as much as a bud covered and choked by earth.

Prepare the soil for planting as follows: Plow the land as early and deeply as possible. If a crop of pea vines or other cultivated green crop has been turned under, all the better. If such crop has been turned under, a top dressing of agricultural lime (500 to 1,000 pounds per acre) will pay.

I find that of all fertilizers cotton-seed meal is the safest to use in the drill. It is less apt to harm a plant when it comes in contact with its roots. One hundred pounds of sulphate of potash or 200 pounds of kainit and 200 pounds of dissolved bone or acid phosphate per acre should be applied around the plants a little later. It can be sown over them during the winter while the plants are dormant and will then do no harm. Wood ashes and stable manure are also excellent for top dressing. Splendid berries can be made with them alone. Never sow fertilizer on a plant wet with dew or rain, winter or summer. It will be sure to stick and burn.

O. W. BLACKNALL, Kittrell, N. C.

**String beans classified as beans.**—The importers claimed that the merchandise is dutiable at 10 per cent. ad valorem as vegetables in their natural state not specially provided for. This merchandise consists of beans in the pod, green. As distinguishing them from dried beans, they are commercially and popularly known as string beans. In the absence of a special provision for beans, they would undoubtedly be dutiable as vegetables in their natural state, but the provision for beans is sufficiently broad to include string beans, and the Board of General Appraisers therefore affirms the decision of the collector.

Our publishers will supply any book wanted. Send your orders.

## From Cemetery to Park.

The work of transforming St. John's burying ground, New York City, into St. John's Park was begun on September 28. The 1,000 tombstones still remaining were broken off at the ground and carted to a large pit in the eastern part of the cemetery. In this they were dumped and earth piled over them.

The cemetery was opened a hundred years ago, and was used until 1850. After 1830 the city ordinances forbade further burials south of Canal street, but for twenty years after the passage of the ordinance burials were permitted in St. John's.

It is estimated that 10,000 interments have taken place in the plot. The property owners and tenants of the vicinity began an agitation about eight years ago to have the burying ground made into a park. Trinity Corporation, which owned the property, resisted the project until the city won a victory in the courts, and the property was bought for \$520,000. The relatives of the dead were notified in September last of the city's intention to soon begin work, and were requested to make removals at once. About 250 graves were opened and fragments of bones were taken to other cemeteries.

## Eastern N. Y. Horticultural Society.

The Executive Committee of the Eastern New York Horticultural Society met on Tuesday morning in the concert hall, Madison Square Garden, New York City. It was decided to hold the next annual meeting at either Newburgh or Highlands, the object of thus moving about being to stimulate interest among fruit growers in different sections. It was decided to hold a two days' convention of five sessions and an interesting program was prepared. Among those attending the meeting were W. F. Tabor, W. C. Hart, S. B. Husted, L. L. Morell, E. Van Alstyne, B. D. Van Buren, J. E. Rice, N. W. Hallock, W. W. Williams, C. L. Allen, J. W. Withers, and Dr. F. M. Hexamer.

## The Successful Farmer.

Referring to the farmer of to-day, William Allen White, who first attracted attention by his trenchant inquiry of "What's the Matter with Kansas?" says, in *Business of a Wheat Farm*, in October Scribner's: "The successful farmer of this generation must be a business man first, and a tiller of the soil afterward. In him must be combined many talents. He must be a capitalist, cautious and crafty; he must be an operator of industrial affairs, daring and resourceful, and he must play labor's part with patience and humility. He is in business as certainly as the banker. And henceforth, until the order changes, the farmer's success in business will quadruple with the kind and quantity of brains he uses, and with the number of fertile acres under his plow."

## Farm Hand in Pennsylvania.

Walter A. Wyckoff's most interesting narrative of his experiences as a laboring man describes in the November Scribner's his work as a farm hand in Pennsylvania. That there is work of this kind for those who want it is evident: "But surely," I said, "more men apply to you for work than you can possibly employ." He looked at me with some wonder at my ignorance. "For a long time I have been looking for a man to help me," he said. "I'm growing old, and I can't do the work that I once did; and if I could find the right man I'd keep him the year round and pay him good wages. But the best young fellows go to the cities, and the rest are mostly a worthless lot. There's hardly a day in the year when I haven't a job for any decent man who'll ask for it."

M. P. Hedrick has been appointed State Inspector of orchards and nurseries by the Michigan State Board of Agriculture.

## There is Not a Home in the Land

But calls for a yearly Calendar.

Every family tries to get one or more; generally more.

## There are Calendars and Calendars

Some are good, some bad, most of them indifferent.

## There Will Not be a Calendar Issued for 1898

To exceed in artistic elegance, finish, beauty of designs and effective coloring, the one we to-day offer as a premium to every subscription to AMERICAN GARDENING received before December 31, 1897.

# EVERY SUBSCRIBER IS ENTITLED TO ONE

AND CAN EASILY EARN TWENTY.

OUR magnificent **Rose and Girl 1898** six sheet Art Calendar, two months to a sheet, each sheet  $8\frac{1}{2} \times 11\frac{1}{4}$  inches, is superbly lithographed in eleven colors, and printed on hammered paper; the whole tastefully tied with silk bow—undoubtedly a work of art fit for the most elegant home, and as handsome a Calendar as was ever published. Each one of the six designs presents a distinct type of female loveliness and a fresh study in roses, the coloring on each sheet being rendered in harmony with the design. There is not a line of advertising on the Calendars to detract from their value. They will not be sold by us for less than \$1.00 each.

### Description

### Who is Entitled to a Calendar?

EVERY SUBSCRIBER renewing before December 31, 1897, enclosing Five Cents additional to pay packing and postage.

EVERY NEW SUBSCRIPTION—To induce people to test the value of AMERICAN GARDENING we will send the Calendar absolutely free to every name received direct not previously on our mailing list. Remit \$1.00 for A. G. 12 months.

EVERY ONE sending us a club of Four 3-month trial subscriptions at twenty-five cents each, will get a Calendar, free as a premium, by return mail.

EVERY NEW name sent in by an agent.

NOTE.—We have ordered manufactured for us a large stock of these superb Calendars in the endeavor to have sufficient supply for all demands, but will not guarantee to fill orders after supply is exhausted. Therefore, order yours now.

**Special to Agents** A copy of our Art Calendar to show people will clinch the argument and obtain the subscription. Bona fide Agents will be mailed one copy, securely wrapped, on receipt of only Twenty-five cents (one-fourth its value.) Armed with this superb Calendar we misjudge human nature greatly if any ordinary man cannot secure a big list of new subscriptions every day. Every new subscriber you send us gets a Calendar by return mail.

### We Pay Agents

Every new subscription at \$1.00 entitles the agent to Five of the Wonderful **Henry Strawberry Plants**, to be delivered next Spring. Thus 100 new subscriptions would secure agents 500 plants; a possession worthy of your consideration. Every new subscriber taken by agent will receive one of our Art Calendars free by return mail. Agents who do not want the Henry Strawberry Plants can retain as their payment **25 cents in cash** on each subscription they take, or will be credited **twenty-five cents** on any book, magazine or publication they wish to obtain through us.

## The Rocky Ford Melons.

Our market reports have, during the past few months, contained several references to Rocky Ford muskmelons which have right along realized such fancy prices, and correspondence is received asking for further information, source of seed, etc.

It is true those melons have given exceedingly good satisfaction. The old-fashioned Emerald Gem or Black Jap gave satisfaction because almost every melon cut was good eating, and therefore they pleased the uninitiated; the Rocky Fords were even better than those in that every melon was a fine eating one. The color inside is greenish white, very juicy and rich, good eating clear to the rind. They are oblong, being 5 to 6 inches long and 4 to 5 inches in width (or depth), and, as far as observation goes, nearly all of a size. They have had an immense run in New York City as well as in Boston. Proprietors of the restaurants and hotels being well pleased because of their sureness of giving a good tasting melon to offer their patrons and the patrons being well pleased because they had a nice eating melon. Very little seed was saved. One farmer eating the melons in a dining room, procured a crate and saved the seed; another farmer approached the proprietor of a dining room, had him save the seed.

According to a recent report in the Fruit Trade Journal, the exceptionally fine quality of these melons depends upon location.

And now we have a cantaloupe trust. Three years ago Mr. Wetzel, president of the Western Poultry and Game Co., was at Rocky Ford, Atero Co., Colo., which is about 50 miles south of Pueblo. It was in the melon season, and he had a Rocky Ford cantaloupe fresh from the vine, and wet with dew for breakfast. It was the most delicious he had ever tasted. He brought some of the seed home with him, gave them to truck farmers. The vines were very prolific, but the transplanted Rocky Fords were just like other Missouri grown cantaloupes. They lacked the rare flavor he had noted in the melons grown on the altitudinous plains of Colorado. In order to test the difference in soil and climate he had a friend at Rocky Ford send him a crate of cantaloupes. The difference was readily apparent.

A company was organized with \$200,000 capital, of which Mr. Wetzel was made President, and general manager. This year there were 800 farmers raising cantaloupes on 632 acres of land.

The Rocky Ford Melon Co. shipped 1,264 cars, of 864 crates each, and there are 45 melons in a crate.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

### Catalogues Received.

W. W. BARNARD & Co., Chicago.—Catalogue of Bulbs, Seeds, Florists' Sundries, etc.

JAMES GRIFFITH, Cincinnati, Ohio.—Price List of Wire Floral Designs.

## PEACH TREES

Guaranteed free from Yellow, Rosette, or San Jose Scale. State inspectors certificate with each order. All standard varieties including Elberta, Kammie, and Triumph. Also Pear, Plum, Apple, and other Trees and small Fruit plants. Catalogue on application.

CHAS. WRIGHT, Sanford, Dela. Mention American Gardening when you write.

## DO YOU NEED WATCHING?

Or, to put it another way,

### Do You Need a Watch?

We sell them, sell them at such an exceedingly low price that you can't afford to go watchless.

Got 'em all sizes and styles.

But we'll just mention two:

An Elgin or Waltham Watch, best movement made, hunting case, accurate time-keeper, handsomely engraved, Pocket Case, heavily gold-plated—last for all time. Ladies' or gentleman's size.

We'll send it to your address with privilege of examination. If it's not entirely as represented, send it back—costs you nothing. If you like it, pay the agent express charges and \$5.50. That's fair. Or this—

A Hunting Case Watch—beautifully engraved case, first-class movement, any size, heavily plated (14k)—looks just like a \$40.00 gold watch—keeps as good time as any of them. Sent to your express agent with privilege of examination—same conditions as all our watches sent out—and if you like it, pay him \$5.45 and express charges.

If you take our word for it, and send money with order, a handsome chain goes with either, and express charges are paid by us, for the prices named above.

tion in this column. No charge is made.***New York.**

The Chrysanthemum show at the American Institute Fair this week, was, considering the early date, a grand success; the classes were well filled and competition was keen, thus, for instance, in the class for the best vase of six white blooms there were eight exhibitors, and in the corresponding class for yellow, seven lots were staged, and so on through the list.

In the class for not less than 10 varieties, six blooms in a vase, G. H. Hale, gardener to J. E. Brown, Bellport, L. I., was first; H. Weber & Sons, Oakland, Md., second. Mr. Hale's lot contained Ivory, Vesuvius, Rider Haggard, Mutual Friend, Philadelphia, Mrs. H. Robinson, Major Bonnaillon, Miss Georgienne Bramhall, Marie Louise, Golden Gate, and Iora.

In the class for five varieties, six blooms of each, A. Herrington, Florham Farms, Madison, N. J., was first with H. Wright, Miss Georgienne Bramhall, Major Bonnaillon, Mrs. H. Robinson, and Ethel Addison; J. N. May, Summit, N. J., was second with smaller, but perhaps neater, blooms. Mr. Herrington was also first in the class for three vases of six blooms each, H. Weber & Sons second.

For the best six blooms of white, Mr. Herrington was again first with six grand erect specimens of Mrs. Henry Robinson; Mrs. William Brennecke was second with larger blooms, but they lacked strength in the neck, and thus failed to show up to advantage. The same variety from J. N. May was also a grand display.

Much interest was evidenced in the competition for the best yellow, inasmuch as the new variety Mrs. Trainor L. Park was exhibited by Ernst Asmus, West Hoboken, in this class. Unfortunately, this truly superb variety was hardly matured enough to be seen at its best, but yet, for all that, it beat the magnificent blooms of Major Bonnaillon exhibited by Mr. Herrington.

For the best vase of pink Dailedouze Bros. were first with Glory of the Pacific, J. N. May securing second with a charming pink named Elvena. For the vase of any other color, Mr. May was first with Sunrise.

In the class calling for 12 Japanese blooms, distinct, Mr. Hale was first and Robert Laurie, gardener to Cornelius Vanderbilt, second; both had heavy massive blooms. Mr. Laurie also secured the prize for the largest and best individual bloom in the show, winning it with a finely characteristic bloom of Mrs. Henry Robinson.

The first honors for a group of Chrysanthemum and foliage plants arranged forefect, covering 100 square feet, went to W. Duckam, gardener to D. Willis James, Madison, N. J., with a grand lot of plants and excellent flowers. For the best specimen Chrysanthemum plant A. Welsing, Brooklyn, was first, the variety being Autumn Bride.

**Miscellaneous Exhibits.**

N. Butterbach, gardener to C. N. Bliss, Oceanic, N. J., staged a remarkably fine lot of Antirrhinum in great variety, also a fine lot of Cosmos, for which he was awarded a special prize. The Diploma of the Institute was awarded to R. Laurie for a remarkable display of Nerines, which, in fact, formed one of the principal attractions of the show; among the most attractive were N. Fothergalli, N. cornuta major, and N. elegans carinata. Judging from this exhibit the Nerine is worthy of a more prominent place as a cut flower.

**Exhibit of Roses.**

The F. R. Pierson Co. and L. M. Noe, Madison, N. J., were the two principal competitors for American Beauty Roses, the first-named firm beating three

times consecutively. W. Turner, A. Taaffe, A. J. Wengert, J. N. May, and Peter Streit were large exhibitors also.

**Novelties and Seedlings.**

Mrs. C. S. Valentine had an interesting collection of these in 25 vases. There were Semple's Asters, pale pink, crimson, pale lavender, and white, which were by far the best Asters in the show. Nasturtium, Mdme. Gunther's Hybrid; Heliathus cucumerifolius, China Pinka, Rosa multiflora nana, a fine specimen grown from seed by exhibitor; Scabiosa maxima plena, novelty of '97, which is all its name signifies, and many others.

**Chrysanthemum and Rose Novelties.**

A. D. Rose, Jersey City, N. J., exhibited white sport from Glory of the Pacific; Peter Streit, Nyack, N. Y., had a yellow sport from Mrs. Henry Robinson; and William Anderson, Manraoneck, N. Y., a new light colored reflexed Japanese bloom intermediate between Glory of the Pacific and Chalfant in form and build. This will be known as Ben Nevils.

H. Weber & Son, Oakland, Md., exhibited the new Rose Mrs. Robert Garrett, for which was awarded a medal of merit. The flower illuminates in a charming manner in artificial light, but failed to satisfy the judges when seen in daylight, owing to the paleness of the outer petals; this, it was claimed by the growers, was largely due to the extremely hot weather to which the blooms had been subjected during the few days previous.

**Madison, N. J.**

There was a full meeting of members of the Morris County Gardeners' and Florists' Society in Masonic Hall, Madison, October 13. The president announced that subscribers to the Society had come forward handsomely, and the financial success of the forthcoming show was assured; it only remained for members to work and get together a display worthy of the support and encouragement the Society had received.

Mr. D. H. Burnett who was to have opened a talk on Violets was prevented from attending, but he sent a bunch of good flowers, while a very fine bunch was on hand of flowers grown by Mr. W. Duckham, gardener to D. Willis James. Mr. Duckham opened the talk with a few brief but pertinent remarks, expressing the opinion that past practice must be considerably modified, in fact, entirely changed, as under the old way of planting the Violets outside for the summer and lifting them into the houses in the fall, results had become so uncertain that he had been led to try the Poughkeepsie grower's plan of planting direct from the cutting bed into their permanent bench quarters. By no other method could he have got flowers so fine so early in the season. He was convinced that the growing and lifting of big plants was a mistake, as they usually failed to fulfil promises, but went right back on the grower. Some interesting conversation followed, descriptive of some of the great Poughkeepsie establishments by members who had visited them in Violet season.

**Newport, R. I.**

Mr. Samuel Matson has been engaged as gardener for David H. King, Jr., Esq., Catherine street. Mr. Matson entered upon his duties to-day; his address is Everett Place.

Our brother gardener, Mr. Robert Laurie, was fairly successful with Chrysanthemums at the Saturday show of the Massachusetts Horticultural Society to-day, 16th, securing first premium for vase of 10 blooms of white with 10 blooms of Mrs. H. Robinson, second for vase of yellow with Marion Henderson, also second with vase of six varieties, one bloom of each.

Mr. Laurie's whole stock of Chrysanthemums are in a very healthy condition, which gives promise of some very fine blooms later on.

The Newport Horticultural Society will hold no Chrysanthemum exhibition this fall, and will hold only one meeting each month, on the fourth Wednesday evening. Members are requested to bring any new

or rare plants which they may have in good condition at the time. A committee on awards to be present at each meeting.

#### Lenox, Mass.

Some of the charming gardens of this fairy spot have just been inspected by garden committee of Massachusetts Horticultural Society. This was on October 14 and all were greatly impressed with the horticultural beauty of Lenox, which they declare excels any town in Massachusetts, if not in New England.

The visitors had a busy day. At 9 o'clock a delegation from the Lenox Horticultural Society called on them and under its escort, the sight-seeing began. "Sunny Croft", the country place of George G. Haven (gr. R. A. Schmidt) was first visited. Here the visitors were shown the extensive greenhouses and lawns, after which "Wheatleigh," the palatial country home of Henry H. Cooke (gr. George Thompson) was visited. Mr. Cooke received the guests.

The greenhouses and graperies were seen and the Bostonians re-embarked in their tally-ho for "Shadow Brook," the country place of Anson Phelps Stokes, one of the largest private residences in America. The magnificent lawns and shrubbery were seen, and then the committee was taken to Stockbridge, where the country home of Lawyer Joseph H. Choate was seen. The party was entertained here by C. R. Russell, superintendent of the place.

Luncheon was enjoyed in Led Lion Inn, and the return trip was made to Lenox by the high road, where "Erskine Park," the magnificent place of George Westinghouse (gr. E. G. Norman) was visited. This place, a marvel of engineering work, shown by canals, wooded islands, rustic bridges of stone and iron, and terraced lawns, was declared the most beautiful place seen on the trip.

From the Westinghouse place David Wolfe Bishop's "Interlaken" and William D. Sloane's "Elm Court" (superintendent, W. Griffin) were seen and admired.

**Flower Show Posters.**—We have received from the Courier Litho. Co., Buffalo N. Y., samples of their new posters for Chrysanthemum shows. These are in two sizes, showing Chrysanthemums in all colors, and could not fail to attract the notice of the passerby.

#### Chrysanthemum Society of America.

**Seedlings.**—The committees judging new seedlings will be in session this and every Saturday up to and including November 27.

Exhibitors should make their entries (a fee of \$2 is charged for each variety exhibited) to the secretary, not later than Tuesday of the week in which the blooms are to be shown.

Blooms may be sent to any of the following addresses, express prepaid:

Boston.—A. H. Fewkes, Horticultural Hall.

New York.—Eugene Dailledouze, care of Dr. F. M. Hexamer, Madison Square Garden.

Philadelphia.—Edwin Lonsdale, 1514 Chestnut street.

Cincinnati.—B. Witterstaetter, corner Fourth and Walnut streets.

Chicago.—W. N. Rudd, room 202, 185 Dearborn street.

**Silver Cup.**—The Chrysanthemum Society's Silver Cup, to be offered annually, will be awarded to the best six varieties, six blooms each (36 blooms in all). The first cup will be competed for October 21 at New York. Competitors should forward their blooms to Dr. F. M. Hexamer, Madison Square Garden, New York City, express prepaid. Competition open to all, no entry fee. For further particulars address Elmer D. Smith, secretary, Adrian, Mich.

#### Coming Exhibitions.

Munro, a man of lifelong experience both in nursery and greenhouse, and under the name of Ames & Munro, there will be offered a full line of trees, shrubs, plants; bulbs, and seeds.

There is more Catarrh in this section of the country than all other diseases put together, and until the last few years was supposed to be incurable. For a great many years doctors pronounced it a local disease, and prescribed local remedies, and by constantly failing to cure with local treatment, pronounced it incurable. Science has proven catarrh to be a constitutional disease, and, therefore, requires constitutional treatment. Hall's Catarrh Cure, manufactured by F. J. Cheney & Co., Toledo, Ohio, is the only constitutional cure on the market. It is taken internally in doses from 10 drops to a teaspoonful. It acts directly on the blood and mucous surfaces of the system. They offer one hundred dollars for any case it fails to cure. Send for circulars and testimonials. Address, F. J. CHENEY & CO., Toledo, O.

Sold by Druggists, 75c.

## Diplomas and Certificates

**HORTICULTURAL SOCIETIES,  
FOR FAIRS, INSTITUTES, : :  
GARDENERS' CLUBS, ETC.**

These should be selected well in advance of the date needed, and secretaries of above should send now for our set of samples, all of which have been especially designed by first-class artists and engravers for the purpose. Owing to the wide demand for these samples and their expensiveness, we will mail the set of five, postpaid, for \$1.00; money refunded on return of samples, or placed to credit of order, as directed. One single sample sent free on application if the writer will explain the exact purpose for which it is wanted.

## Raise Hens

People living just outside cities and large towns can (owing to their nearness to markets,) make large profits in the poultry business. No other occupation pays better or is easier to conduct. It can be successfully carried on by women or boys and girls, provided they have a knowledge of the right methods of management, feeding, etc. This may easily be gained by faithful study of that best and most practical poultry paper,

## Farm-Poultry

It teaches how to make money raising poultry and eggs for market. It is edited by practical poultry raisers, who tell their readers how to prevent and cure all poultry diseases; bring pullets to early laying maturity; make hens lay when prices are highest; build the best houses and yards; keep poultry free from vermin; hatch strong chickens in incubators; caponize and dress poultry for market. Published semi-monthly.

Price, \$1.00 a year; 50 cents for six months. Sample copy and a 25c. book, "A Living from Poultry," sent for 12c. in stamps.

## ALL ABOUT THE HOME PLOT

### POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

#### Open Soil in Pots.

From now on, one of the most difficult points to keep in mind, and to insure, is that of freely open soil. Constant watering bakes the surface; too free use of liquids of every sort chokes the pores of the soil; and the constant effect of the sunlight adds to the hardening and solidifying process. Careful cultivation of the surface will help, after the mischief has been done. Turning the pots frequently will prove a defence from some of the evils which the sun might otherwise cause. Watering from below, instead of at the surface, will avoid much of the difficulty, and the disuse of clogging stimulants will prove another aid. Meantime, it needs to be reiterated that an open soil is, as a rule, absolutely necessary to the health and vigor of indoor plants.

#### The Best Season for Obtaining Palms.

"If you are a window gardener at what season would you prefer to buy Palms?" I asked the grower of a large firm one day last week. "Autumn is the best season of the whole year to my mind," he replied "because throughout the Summer the plants have been grown with natural heat and with an abundance of fresh air and have become stocky and hardened to an extent that does not obtain at any other season. They are also ready for the resting period. Thus it is not possible for removal into hard conditions to do them the damage that must occur from removal when in the soft and sappy state induced by free growth in close moist conditions."

#### Choice of Window Palms.

"What do you consider the best Palm for growth in the dwelling," is a question I always have in stock for the expert. The last one to whom this question was put declared unhesitatingly in favor of *Latania borbonica*. After this the choice would be the *Kentias*, *Belmoreana* and *Forsteriana*. Being asked why he considered these better than the *Areca*s, he replied that in the first place they formed handsomer plants. The *Areca*s, too, were, as a class, less responsive to a certain amount of handling and growing on, than the others. And complaints from unsatisfied customers, in very large proportion, concerned the *Areca*s.

#### Camassia Cusickii.

Not one published report concerning the behavior of this novelty of last year has come to my notice. Our own bulb was received late, and in an immature state, and furnished nothing but leaves for the delectation of the experimenter. This year, this *Camassia* is held at the same price as last year, a price

that will keep it from the masses. If it equals the descriptions, it must prove a delightful bulb for those windows that have plenty of room. It is catalogued as a grand new species with especially fine leaves, blooming in wonderful profusion, and carrying hundreds of pale, sky-blue flowers, the blooming racemes being two or three feet long.

#### Some Satisfying Bulbs.

Among the most delightful of the window bulbs is the great, sweet-scented Jonquil, catalogued as *odorus regulosus*. It is so cheap that one may have a pot full of bulbs at a time, and is nearly as large as the Daffodil. It carries more than one bloom to the stalk, is quite lasting, and lights up the whole window with its brilliant yellow. A bulb of different style, unpretentious in coloring, is neglected by many, perhaps because not more praised; this is the Allium. At 15c. a dozen, one may be liberal and have one or even two (!) pots at a time. The large clusters of pearly white blooms call forth admiration from all who see them, and are produced successively for some weeks.

#### Cyclamen Giganteum.

If one has never grown a Cyclamen, it needs but a single visit to a flower store, or an exhibition, to become its ardent admirer. The foliage of the new sorts is as admirable, perhaps, as any known plant. It is excellent for window use. As to bloom, when well treated it is almost amazing. As to size, plants are now exhibited by scores which run between an inch and a half and two inches in length of petal, and these are wide enough to form a very handsome flower. It is now shown in both single and double forms, though, of course, capable of improvement in the last.

#### Palestine Iris.

One of the more enterprising firms offers Iris this season as a novelty, under the above name, in four different styles. One is (so-called) black; another sky-blue, with blotches of white and yellow; a third lilac-pink, mingled with rich purple, and still another delicate straw color veined with blue, and blotched with crimson, brown, and black. They are offered as almost without rivals among bulbs for winter pot culture, and booked as requiring no special care, while rivaling in beauty the choicest orchids. Of course the price for all this is not low, as bulbs go.

#### Pluck and Success.

It takes pluck to invest money in novelties at a high price, without knowledge as to their proper treatment, and with failure often appearing more probable than success. It takes pluck, too, to invest hard-earned cash in decorative stuff, which, beautiful indeed in the florists' hands, may prove anything but beautiful under less favorable conditions. All these the experimenter must do, and the average grower often dares for the interest there is in it. And, somehow, the pluck often seems to bring success with it, just because it is pluck, in company with brains. Far from any of the cities I recently found a little woman luxuriating in greenhouse seedlings, in English Primroses, in *Spiraea Astilbe* for the window, and even in *Genistas*, with all of which she was succeeding marvelously.

#### Pullets Against Hens.

Almost everybody is matching them in these days. And the pullets are better than the hens, generally speaking, for late fall and early winter. But we have no proof in our own experience that for the whole year pullets are always the best. Indeed, during the past year a certain yard of two-year-old hens has laid better in proportion than the pullets. They were not, however, of the same breed as the pullets, and it is here that a limitation must be put on the statement that pullets are better than hens. Hens of some breeds may do better for the year than pullets of some other breed.

#### The Early Layer.

One of the farm papers has been having a general discussion as to the safety of forcing pullets to early laying. Half a dozen or so of the best poultry men of the country are represented in

Mention American Gardening when you write.

is symposium, and they agree wonder-  
fully in their testimony. The general  
pinion, deduced from years of actual  
perience is that the majority of the pul-  
ts, of whatever breed, will not begin to  
y before five or six months of age.  
he concensus of opinion is even more  
rongly in favor of non-forcing methods.  
et growth, frame, constitution, first,  
en you may safely force to some extent  
the idea.

a the Fence.  
Right by the roadside, in two in-  
ances, in a single farm neighborhood,  
5 chicks, half-grown, were seen roost-  
g. It was a dangerous position for  
ore reasons than one. It is just this  
osition that an interested reader of  
ome Plot notes charges the writer with  
ecupping. "Why do you say in the  
me notes (page 607) that trees are not  
t for poultry roosts, and that they make  
ood poultry roosts?" "You have mis-  
aken me," was the reply. "I was merely  
ying to say that there are arguments  
n both sides." Now, however, the sea-  
on is past for such thinking. Now,  
ideed, the chicks must come off their  
erches in the trees and try the warmer,  
ryer, and safer perches of lockable build-  
ings. Let the doors and windows stand  
ide throughout the day.

he Contagion of Boup.  
The great source of contagion with  
oup, it should not be necessary to say,  
is the mouth of the sick bird. Allemana-  
ions therefrom, in places where other  
owls can be infected by them, are imme-  
diate sources of the disease. The great  
ack on most places where poultry is  
aised is a "hospital" for possible sick  
owls. It need not be wasted if there are  
o sick birds, for there are scores of times  
when a small, dry cooping place comes  
andy. Without a hospital, it is impos-  
ible to prevent the spread of infectious  
laseases of the head through the medium  
of the drinking water. MYRA V. NORBY.

SOME

BARGAINS IN

CLUBS

FOR

Men, Women and the Young.

Ohio Farmer, a giant among the agri-  
cultural weeklies, and American Gardening,  
The two, one year, For \$1.60.

Farm, Field and Fireside, a 32 to  
40 page weekly Farm and Family Journal,  
the best of its class, and American Gardening,  
The two, one year, For \$1.50.

Country Gentleman. This weekly am-  
ply covers the field its title indicates. Every  
country gentleman should subscribe to it.  
And American Gardening.  
The two, one year, For \$2.75.

Farm Journal, the "little giant" of  
monthly journalism in matters agricultural,  
and American Gardening,  
The two, one year, For \$1.25.

Farm Poultry (semi-monthly), and  
American Gardening,  
The two, one year, For \$1.50.

Poultry Monthly and American Gardening,  
The two, one year, For \$1.25.

Above is your choice of two most excellent  
poultry magazines. And nearly every one  
of our readers keeps poultry. Why not  
subscribe to both? The two poultry papers  
and American Gardening, one year, For  
\$2.25.

Meehan's Monthly, a horticultural  
stand-by, and American Gardening,  
The two, one year, For \$2.85.

Harper's Magazine, as good as ever;  
none better among the literary monthlies,  
and American Gardening,  
The two, one year, For \$4.25.

Ladies' Home Journal, an unrivaled  
monthly for women, the standard in its  
class, and American Gardening,  
The two, one year, For \$1.90.

Youth's Companion, of Boston. At  
the head of all journals for both boys and  
girls, and read by the elders, too. New  
Subscribers Only and American Gar-  
dening,  
The two, one year, For \$2.85

OUR CLUB LIST

LET US FILL YOUR ORDERS FOR 1898.

Below we print a comprehensive list of the leading publications  
of the day. When more than one is wanted in club we will be  
pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club  
with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends  
to place their orders through us and to enable them to obtain their literature at a great  
saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or  
magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second  
column [B] our price, including AMERICAN GARDENING for one year.

## WHOLESALE MARKETS.

### New York.

The stagnation and over-stocked condition of the market in all branches at the present time is deplorable. No such thing as fixed values or moderately good prices are possible any more, no matter which line is taken, whether it be flowers, fruits, or vegetables, the overstock and lack of demand are the same in all.

Domestic grapes are feeling the depression most keenly perhaps; at the beginning of the week 32 carloads were sold by auction, and 12 by private sale.

Pears are very abundant and move slowly; apples are also in very large supply, much of the stock is selling 25c. per barrel lower than regular quotations.

Mushrooms are selling at from 50 to 75c. per pound.

Tomatoes 30 to 40c. per pound.

Cucumbers 75c. to \$1 per dozen.

There is a liberal offering of apples of nearly all kinds; the finest varieties of southern fruit are showing irregular quality and value; fanciest lots are held with some confidence, but it requires unusually high grade stock to reach our outside figures; a large part of the Wine Sap, Johnsons' Winter, etc., are selling in range of \$2.50@3.50. There is a little shipping demand for strictly choice export qualities, and such are fairly steady; the market is liberally supplied with undergrade fruit from all sections for which holders are pressing for sales at weak and irregular figures. Jonathan, western, per barrel, \$3.50@4.50; Missouri Pippin, western, per barrel, \$3@4; Albermarle Pippin, Virginia, per barrel, \$3.50@5; Wine Sap, Virginia, per barrel, \$2.50@4; Johnsons' Winter, Virginia, per barrel, \$2.50@4; Fall Pippin, hand-picked, per d.-h. barrel, \$2.25@2.75; Twenty-Ounce, hand-picked, per d.-h. barrel, \$2@2.50; King, hand-picked, per d.-h. barrel, \$2.25@3; Ben Davis, western, per barrel, \$2.50@2.75; Ben Davis, Jersey, per barrel, \$1.75@2.25; Greening, hand-picked, per d.-h. barrel, \$1.50@2.25; Baldwin, fancy lines, per barrel, \$2.25; Baldwin, fair to good, per d.-h. barrel, \$1.50@2; mixed varieties, fair to good, per barrel, \$1.75@2; mixed varieties, poor to fair, per barrel, \$1.25@1.50; Jersey, winter, open heads, \$1@1.25.

Peaches continue scarce; we see no strictly extra fresh fruit offering and the usual qualities are selling at moderate prices.

Bartlett pears are dull and irregular; fancy lots of Seckle, Sheldon and Beurré Boisé meet a fair demand; common kinds of these, and nearly all other varieties are moving very slowly.

Quinces continue dull; very fancy bright colored stock might bring a slight premium.

Delaware grapes fairly steady; Niagara dull and heavy; Concord moving slowly; prices show no further change; wine grapes in fair demand; sales of Concord, however, above 1½c. are very exceptional.

Cranberries quiet but held steady.

Peaches—Maryland, per carrier, \$1.25@2.25; Jersey, choice, per basket, 80c.@\$1; Jersey, fair to good, per basket, 60@75c.; Jersey, common, per basket, 40@50c.

Pears—Bartlett, large, clean, per barrel, \$2.50@3.50; Bartlett, poor to fair, per barrel, 50c.@\$2; Bartlett, per bushel box, 50c.@\$1.50; Seckle, per barrel, \$2.50@3; Seckle, per bushel box, \$1.25@2.25; Beurré Boisé, per barrel, \$1.50@3; Sheldon, per barrel, \$1.50@2.25; Kettler, Jersey, per barrel, \$1.50@2; Beurré d'Anjou, per barrel, \$1.25@1.75; other late sorts, fair to good, per barrel, \$1@1.50.

Quinces—Apple, good to prime, per barrel, \$2@2.50; poor to fair, per barrel, \$1.25@1.75.

Grapes—Delaware, Keuka, per small basket, 13c.; Delaware, other state, per small basket, 10@12c.; Niagara, western N. Y., per small basket, 7@10c.; Niagara, per 20-pound basket, 30c.; Catawba,

western N. Y., per small basket, 10@11c.; Concord, up-river, per case, 35@45c.; Concord, western N. Y., per large basket, 10@12c.; Concord, western N. Y., per small basket, 6@8½c.; black varieties, up-river, per small basket 5¼@6c.

Plums—French prune, per 8@10-pound basket, 40@50c.; German prune, 8@10-pound basket, 25@40c.; Copper, per 8@10-pound basket, 20@25c.; Gage and Rheine Claude, 8@10-pound basket, 15@20c.; Damson, per 8@10-pound basket, 10@20c.; Damson, up-river, per crate, 30@35c.

Cranberries—Cape Cod, special varieties, fancy, large dark, per barrel, \$6@6.25; fancy, Early Black, per barrel, \$5.50@5.75; choice, dark, per barrel, \$5@5.25; fair color, per barrel, \$4.50@4.75; defective, per barrel, \$4@4.25; per crate, \$1.80@1.85; Jersey, light to medium color, per crate, \$1.50@1.75.

Oranges—Florida, fair to choice, per box, \$3@4.50; grape fruit, bright, per box, \$6@6.50.

Nuts—The receipts of chestnuts are considerably larger to-day and prices show a decline of fully \$1 per bushel; early sales were at the highest prices; later deliveries seldom reach our top quotations. Hickory nuts about steady. Chestnuts, northern, per bushel, 50 pounds, \$4.50@5.50; chestnuts, southern, per bushel, 60 pounds, \$4@4.50; hickory nuts, per bushel, 50 pounds, \$1.50; bull nuts, per bushel, \$1.

There is a fair supply of Orange County onions offering and warm weather has been unfavorable to the condition of the goods; very little of the stock is of choice quality and outside quotations are extreme, although sustained on really fine goods. Cauliflowers are again mostly in bad order and of poor quality and dragging at low and unsatisfactory prices. Celery dull and weaker. Southern green peas are of very irregular quality and value; some poor lots cleaned up at 50c. per basket, but the best met a moderate demand at \$1@1.50. We see no fresh receipts of southern beans. There is little change in other kinds of vegetables.

Cauliflower—Fancy, per barrel, \$1.50; poor to fair, per barrel, 50c.@\$1.25.

Celery—Choice to fancy, large, per dozen, 25c.; fair to prime, per dozen, 12@20c.; small and poor, per dozen, 8@10c.

Corn—Per 100, \$1.25@1.50.

Cabbages—Jersey and Long Island, per 100, \$3.50@4; state, per 100, \$3@3.50.

Cucumbers—Shelter Island, per barrel, \$2.50@3.50; selected, per 100, \$1@1.50; Florida, per crate, 40@75c.

Egg plant—Jersey, per barrel, \$1@1.25; Jersey, per one-half barrel box, 50@65c.

Green peas—Virginia, per basket, 50c.@\$1.50; Charleston, per basket, \$1.25@1.50.

Lima beans—Jersey, Potato, per bag, 75c.@\$1.50; Jersey, flat, per bag, 50@75c.

Onions—Orange Co., red, prime, per bag, \$1.50@2; Orange Co., yellow, per bag, \$1.50; Orange Co., white, per bag, \$1.50@3; Orange Co., inferior, per bag, \$1@1.25; state and west, yellow, per barrel, \$1@1.62; Shelter Island, yellow, per barrel, \$1.75@2; eastern, white, per barrel, \$3@3.50; eastern, red, per barrel, \$2.25; eastern, yellow, per barrel, \$2@2.25; small, white, per barrel, \$3@4.

Okra—Florida, per carrier, \$2.50@3.

Peppers—Jersey, red, per barrel, \$1@1.50; Jersey, green, per barrel, 60c.@\$1.25.

String beans—Va., per basket, 25@50c.

Squash—Hubbard, per barrel, 75c.@\$1; Marrow, per barrel, 75c.

Turnips—Russia, Can., car lots, per barrel, 75@85c.

Potatoes—Receipts to-day, 3,840 bbls. The market for round potatoes continues extremely dull and prices are weak and irregular; the small business reported is at unchanged prices, but it is impossible to force sales. Jersey sweet potatoes about steady; Virginia stock weaker; sales mainly at \$1.50@1.62, some of the small barrels weighing only about 120 pounds are unsaleable above \$1.25; a few extra large barrels of fancy reach \$1.75. Long Island, in bulk, per barrel, \$2.25; Jersey, per bag, bag included, \$2; choice round, in bulk, per

barrel, \$1.87@2; fair to good, in bulk, per barrel, \$1.50@1.75; state, in bulk, per 180 pounds, \$1.75@2; per sack, \$1.75@2; western, per 180 pounds, \$1.75@2; sweet potatoes, Vineland, fancy, per barrel, \$2.25@2.50.

### Boston.

Pear market slightly easier. Prices named below are for the general runs, readers however might understand that something very fancy of the following varieties commands a little more money than what is mentioned. Seckels \$1.25@2 a bushel; Sheldons or Buerré Bosc, \$2@2.50; Howels, \$1.25@1.50; Commice, \$1.50@2; Buerré D'Anjou, \$1 a bushel; some Keiffers, Hudson River stock, 1.50 a barrel; Bartletts from cold storage are having hard sledding, and bring most any price the purchaser is willing to give. Readers will remember the Bartlett was inferior in quality to that found most any year, while other varieties have been nearly up to their usual standard.

Lettuce very quiet generally speaking. If large heads can be found, customers can be had willing to pay good fair prices; peaches are higher because of their scarcity; about done for this year. Hot-house tomatoes, good demand, 15@20c. a pound; somehow the frost did not kill all the field stock, and the past few days have brought forward quite good quantities. Best selling \$2 a bushel; inferior not wanted.

Friday thermometer 86 in this city; Saturday 89. Your readers know what that means on fruits and vegetables. Apples and potatoes suffered the most. Cooler weather this morning, with better tone to the market, with Ben Davis generally selling \$2.25 for a choice article. Greenings, Baldwins and Spies \$2.25; fancy eating apples, high-colored stock, take a range of \$2.75@3.50. A few fancy Gravensteins still continue to command extreme figures.

Hothouse grapes come in in quantities to sufficiently supply the demand, at 85@75c. a pound.

In the pony baskets Delawares 10c., Niagaras 9c., Concorde 7c., Marthas 8c., few Catawbas just appearing, bring 7c.

Onions are a shade firmer, \$2@2.25 a barrel; celery 75c.@\$1.25 a dozen.

Horticultural beans 50@75c. bushel; Sievas and Limas \$1@1.50; quantity decreasing and likewise the demand. Just at present market does not seek the second growing of string beans.

Good fair call for cauliflower, 10@18c. a head. Cabbage unchanged 8@4c. each. Cucumbers from the hothouses holding their own, \$3@5 a hundred. With cooler weather there should be a better trade in them.

Cranberries are again easier, although will not quote any lower, \$5@5.50 a barrel; crates \$1.50@1.75.

Peppers and egg plants in limited demand; carrots 50@75c. a bushel; beets 85@40c.; parsnips 65@75c.; turnips 40@50c.; corn gone by.

Squash also was affected by the warm weather; \$1 buys a good barrel of Marrow, while Hubbard, Turbans, or Bay State can be had at \$1.25; Minnesota or Michigan hard-shelled Hubbard moves slowly at around \$20 per ton.

Twelve bunches of mint sold at 40c.; a bushel of parsley can be had for 50c.

Potatoes struck a decline all around of 5c. a bushel; 60@65c. buys best Hebrons. The people this year are taking white varieties by five to one; same as style in dress changes, so the demand for white or red potatoes changes, and no one knows why.

Quite fair demand for mushrooms \$1 a pound; eastern Shore sweets can be had for \$1.50 a barrel, with Norfolk stock in larger barrel \$1.75.

Quinces 35c. a peck; near-by stock quite plenty, likewise shipments from New York state.

Chestnuts very good demand, about \$6 a bushel; shellbarks \$1.50@1.75.

### Philadelphia.

This market has been rather quiet this past week; all kinds of stock appears to be plentiful but buyers are very cautious.

Receipts of apples have been larger and prices have been somewhat easier. Peaches are about over; those now on sale are from cold storage. Supplies of grapes have fallen off, and the market is firm with a fair demand. Pears are in moderate supply and move fairly well.

Apples—Jonathan, choice and fancy, per barrel, \$8.25@8.50; Gravenstein, choice, hand-picked, per barrel, \$2.50@3; Detroit and Twenty-One, choice, hand-picked, per barrel, \$2.25@2.50; Ben Davis, choice, per barrel, \$2@2.25; fair to good, \$1.50@1.75; mixed varieties, choice, per barrel, \$2@2.25; fair to good, per barrel, \$1.50@1.75.

Quinces—Choice, per barrel, \$2@2.50; fair to good, per barrel, \$1@1.50.

Pears—Bartlett, choice, per barrel, \$3@4; fair to good, per barrel, \$2.25@2.50; per bushel keg, choice, \$1@1.50; Seckel, per barrel, \$2.50@3.50; per one-half barrel, \$1.50@2; Louise Bonne, per barrel, \$1.50@2; Duchess, per barrel, \$1.50@2.

Grapes—N. Y. Concord, 5-pound basket 6@7c.; 10-pound basket, 11@12c.; N. Y. Delaware, per 5-pound basket, 10@12c.; Niagara, per 5-pound basket, 9@11c.

Cranberries—Cape Cod, per barrel, \$4.50@5.50; per crate, \$1.75@2.25; Jersey, per crate, \$1.50@2.

Cauliflowers—Per barrel, choice, \$1.50@2.25; fair to good, \$1@1.25.

Celery—Choice, per dozen, 25@30c.; fair, 15@20c.

Cabbage—Jersey, per 100, \$1.75@2.50. Cucumbers—Per 100, 75c.@\$1; Florida, per crate, 50@75c.

Egg plant—Jersey, per one-half barrel box, 50@75c.

Green peas—Per bushel basket, 75c.@\$1.

Lima beans—Per bag, 75c.@\$1.25; per 100 pounds, \$2@2.40; string beans, Southern, per basket, 30@40c.

Onions—Yellow, per barrel, \$1.75@2.50; white, per barrel, \$2@2.50; per bushel, 60@70c.

Potatoes—Receipts are much larger, and the market has been easier; a large proportion of the supply is of medium to poor stock. Choice, per bushel, 60@65c.; fair to good, per bushel, 50@55c. Jersey Sweets, per five-eighths basket, 25@35c.

### A Good Cheap Farm Wagon.

In order to introduce their low metal wheels with wide tires, the Empire Mfg. Co., Quincy, Ill., have placed upon the market a farmers' handy wagon, sold at \$19.95. The bed of wagon is only 25 inches high, fitted with 24 and 30-inch

wheels, with 4-inch tires, either straight or staggered spokes. Catalogue giving full description will be mailed upon application to the manufacturers, who also furnish metal wheels at low prices, made any size and width of tire to fit any axle.

We solicit from our readers notes of experience and observation. While our space is limited we will always manage to make room for any communication that contains germs of real, practical value to fellow-subscribers.

## A THRILLING RESCUE

### A YOUNG LIFE SAVED IN A REMARKABLE MANNER

#### Florence Sturdivant, of Grindstone Island, Saved from an Untimely Death—Her Dangerous Predicament.

From "On The St. Lawrence," Clayton, N. Y.

Among the Thousand Islands is one called Grindstone. It is seven miles long and three wide. The inhabitants of this island are a well-informed class of people who devote their energies to farming and quarrying for a livelihood. In the home of one of these islanders resides Florence J. Sturdivant, the four-year-old daughter of Mr. and Mrs. William H. Sturdivant. She had a remarkable experience recently.

FLORENCE J. STURDIVANT.

In an interview with a reporter Mr. Sturdivant said: "Florence was taken sick in February, 1896, with scarlet fever and we immediately called a physician. After two weeks the fever subsided but Florence was left with a very weak back. Severe pains were constantly in the back and stomach. The difficulty seemed to baffle the efforts of the physician.

"Finally at the end of four months of treatment, we found our patient completely prostrated. At this time we called

an eminent physician, who agreed with the diagnosis of our physician. He prescribed a course of treatment and we followed it faithfully for three months, but instead of improving, Florence failed.

"A brother of my wife, who resided in Canada, but was visiting us, advised us to use Dr. Williams' Pink Pills for Pale People, and I purchased a box of the pills and began to give them to Florence. This was in October, 1896. After using the pills a short time we could see an improvement. Her strength began to return and her appetite was restored. When she had taken one box the pains in her back and stomach ceased and her recovery seemed certain.

"We eagerly purchased a second box of pills and watched with delight the change for the better that was being wrought daily. Florence finally became strong enough to walk a little. She gained in flesh and strength rapidly. By the time she had used three boxes of the pills she was evidently well. We continued the treatment using another box, the fourth, to prevent the possibility of a recurrence of the difficulty.

"We cannot praise too highly the value of Dr. Williams' Pink Pills. I am positive that without their use our child would have been a confirmed invalid."

(Signed) WILLIAM H. STURDIVANT.

Subscribed and sworn to before me this sixth day of April, 1897.

H. W. MORSE, Notary Public.

Dr. Williams' Pink Pills for Pale People are sold by all dealers, or will be sent postpaid on receipt of price, 50 cents a box or six boxes for \$2.50 (they are never sold in bulk, or by the 100), by addressing Dr. Williams' Medicine Co., Schenectady, N. Y.

# Henry Strawberry Plant Premiums

Will be shipped to all who desire them this season until ground freezes.

Owing to the wonderful run on this unequaled Strawberry we are preparing 100,000 Henry plants for Spring delivery, and in this connection we desire our readers to remember

## Two Facts

1—The Henry Strawberry can be obtained solely through a subscription to AMERICAN GARDENING; as the publishers will not sell plants under any consideration;

2—Neither will Mr. Jerolaman.

## Who is Entitled to

New and Renewal Subscribers.—Plants of the Henry will be mailed, postpaid, as a premium to every Renewal or New Subscriber sending us \$1.00 for a year's subscription. When remitting be sure to state if you want this premium.

To Agents and Workers.—For every \$1.00 received from agents and others for New Subscriptions, we mail, postpaid, Ten Henry plants, Five to the New Subscriber and Five to the Agent.

## Special to Club Raisers!

Clubs of Ten.—To every agent sending us in a club of Ten New Names and \$10.00, we will forward in payment therefor One Hundred (100) Henry Strawberry Plants, by express, as well as send Five plants, postpaid, to each person in the club.

Mr. Jerolaman's series of articles has been put in pamphlet form; and agents will be supplied with copies on application. Best campaign matter out.

Address Your Letters,

**AMERICAN GARDENING,**  
P. O. Box 1697, NEW YORK.

## STANDARD FLOWER POTS

Send for our new price list with extra discounts. All of our pots from 7 in. and upwards have our Patent Excelsior Bottom which is a great advantage, as it secures perfect drainage. A Full Line of Ball Pots.  
THE WHILLDIN POTTERY CO., 713-719 WHARTON ST. PHILADELPHIA.  
BRANCH WAREHOUSES: { Kearney and Westside Avenues, JERSEY CITY, N. J.  
Jackson Avenue and Pearson Street, LONG ISLAND CITY, N. Y.  
Mention American Gardening when you write.

## GLASS FOR GREENHOUSES, GRAP- ERIES, CONSERVATORIES, HOTHOUSES AND HOTBEDS. GLASS

**VANHORNE, GRIFFEN & CO.,**  
Importers of French Glass. 40 to 48 VESTRY STREET, COR. GREENWICH ST. NEW YORK.  
Mention American Gardening when you write.

## GREENHOUSE HEATING AND VENTILATING,

Horticultural Architecture and Building.

**Hitchings & Co**

ESTABLISHED 1844.

233 Mercer Street, NEW YORK.

**FIVE PATTERNS OF BOILERS**  
NINETEEN SIZES

Perfect Sash Raising Apparatus  
Rosehouses, Greenhouses, Etc., of Iron Frame Construction erected complete or the Structural Iron Work shipped ready for erection.

Iron Frame Benches with the "Perfect Drainage Bench Tile" or Slate Tops.

SEND 4c. POSTAGE FOR ILLUSTRATED CATALOGUE.

Mention American Gardening when you write.

## LORD & BURNHAM CO.,

Horticultural Architects and Builders and Manufacturers of Heating and Ventilating Apparatus.

(Established 1856.)

Plans and estimates furnished on application for Heating and Ventilating Apparatus complete, or for material only. Highest Awards at the World's Fair.

NEW SECTIONAL HOT WATER HEATER.

Specially adapted to large ranges. Will heat up to 16,500 feet of glass. Highest economy. Moderate cost. Also heaters for smaller work. Send six cents postage to New York office for latest catalogue of Heating and Ventilating Apparatus.

## THE CULTIVATION OF ENGLISH CUCUMBERS.

Considerable interest attaches to the English cucumber as a crop under glass and we take pleasure in presenting herewith an illustration, from a photograph, of one of the most successful results that have been brought under our notice. The picture speaks for itself and for the skill of the grower whose notes are attached. The variety is Rollison's Telegraph. Mr. Rollison, superintendent to J. E. Brown, Bellport, L. I., gives the following details as to his methods of procedure:

bottom heat. After the plants are well up, give plenty of light, and when the pots are filled with roots give a shift into 3½ or 4-inch pots, and when necessary a further shift into 6-inch pots is given.

"By the time these sizes are full of roots, it is the middle of May and at that time, all the bedding plants being transferred to cold frames to make room, the plants are planted in the benches. I place one wheelbarrow full of rich, light, turfy loam

FIG. 209 — A FINE SHOWING OF ENGLISH CUCUMBERS.

Rollison's Telegraph cucumber is a very free fruiting variety and very tender, the fruit growing from 20 to 35 inches in length. In order to have good results the plants must be kept growing and in good health from the time the seedling appears above ground, and the crop can be had all the year round by sowing seed every three or four months. For summer crop I sow seed in March in a temperature of 65°, using a single seed in a 2½-inch pot and plunging in a mild

every six or eight feet on the bench, adding to each barrow load of soil one 5-inch pot of fine bone dust such as is used for Roses, and mix thoroughly. Put the plant on the top of the mound after having allowed sufficient time for it to warm up and from this time on it must be kept well syringed twice a day during fine weather. "The temperature of the house at night is 60 to 65 degrees and by day 85 to 90 degrees, the atmosphere being kept well

charged with moisture during hot days.

"I train the growths on a wire trellis about nine inches from the glass, letting the leader run to the centre of the span before stopping it in order to obtain ramifications for covering the trellis. The growths must be regulated by thinning out all useless wood, such as unfruitful laterals, etc., or they would soon become over-crowded and greatly weakened.

"The fruit laterals should be stopped at one, two, three, or four joints above the fruit, according to the space to be filled, and should be trained regularly and not too thickly. By so doing they will be less subject to disease, and will bear an abundance of fruit in succession.

"In former times great pains were taken to fertilize the female flowers, but that is all unnecessary except where fruit is grown for seed, as without such attention the fruit grows to the same size and for table use is all the better for the absence of seeds.

It is necessary to watch closely for thrips, red spider, and green fly, and fumigating must be done lightly and often. The syringe or hose is the best preventive of and cure for red spider if used properly.

"Additional soil should be given as a top dressing every time the white roots appear on the surface of the mound."

### Roses Under Glass.

What I call improper watering is a dribble; such quantity applied every day only going down an inch or so and keeping the surface wet all the time. As I have stated before, some varieties need larger quantities of water than others; but that does not mean that the former should be kept in the manner just described. I let my beds get on the dry side, according to the varieties; then they get a thorough watering to the bottom. Of course, there always will be found a few wet and dry spots, and these receive due attention.

There is another matter of equal importance just now. Where plants have made a large growth, they will begin to show signs that they could stand a little extra nourishment. This will be all the more noticeable where very little manure was used in the soil. Last winter I described the formula that gave me both practical and efficient returns for making and distributing manure water, and for the benefit of those who did not read it, or who have since come to the conclusion that feeding with liquid manure is a good thing (which it most assuredly is when properly done), I will repeat it: One pound nitrate of soda and one bushel of cow manure to a barrel of water; or if sheep manure is used, one-half the quantity will be sufficient. This is reduced to one-half when applied with the Kinney pump, which device has my heartiest approval for distributing purposes. This pump, although a very plain affair, is easily put out of working order if the manure water is not properly screened. I find it best to run the liquid through 1/4-inch wire mesh netting, before using. A 3/4-inch hose must be used for distributing, while 1/2-inch can be used for suction. As long as you have enough hose to reach through a house the liquid can be made outdoors or in the shop, as the pump will draw it any distance. It is also essential that good hoses and washers be used, as the job must be as nearly air-tight as possible. As the making of the manure water, screening, etc., can be done in a great many ways, I leave that part to your inventive genius. Don't use the liquid too often—once in ten days will be sufficient—and when applying it do it in the same manner as you would apply clean water by allowing the soil to become in such a condition that it will take a good dose to reach the bottom. It is a great mistake to use it when the beds are wet. The nitrate of soda should be discontinued after the plants have attained their deep rich color, but keep on giving the animal manure.

### The Late Charles A. Dana.

[See Special Supplement for Portrait.]

Charles Anderson Dana, whose death was briefly recorded in our last issue, was a man prominent in many ways, and best known publicly, perhaps, as the editor of the New York Sun. Of his career as a journalist it is not our province to speak; to our readers Mr. Dana will be remembered as the owner of that fair garden, Dosoris, Long Island, in which was such a collection of rare and interesting plants. In his youth Mr. Dana was a member of the Brook Farm community where his attention was devoted to the care of the fruit, and it is not improbable that the associations of that period, working on his spiritual composition, fostered and brought into stronger manifestation his innate love for nature.

Charles A. Dana had a deeply-seated taste for the natural and the beautiful, with an instinctive love for fine landscape effects, noble trees, and pretty flowers—they were poetry to him, and from his early life he made himself familiar with them. A country home and its restful country associations were to him, as they are to all progressive men, the ideal home, and when prosperity smiled generously upon his business efforts, about twenty-five years ago, he bought West Island, Dosoris, Glen Cove, L. I., and at once set about to convert it from a plain, old-time place, to what a country home consistent with his ideas should be. He built heavy walls of masonry around his island home to protect its banks from the inroads of the sea, graded and rearranged his grounds and otherwise plunged deeply into the gratification of his taste for advanced horticulture, and thus did Dosoris become famed.

The island, consisting of nearly 50 acres, is all a garden and pleasure ground, laid out on advanced common sense principles, giving beauty of landscape with diversity in planting. From the first Mr. Dana began to gather together trees and shrubs and other plants, both native and exotic, the best and rarest of everything, till Dosoris Island was more like a museum of living plants than a busy gentleman's private garden. And Mr. Dana knew his trees and loved them as he did his children. Every one was cultivated as a perfect specimen and to-day the trees on the estate stand unrivaled in the country for fullness, beauty and symmetry of form.

Mr. Dana knew plants intimately, he knew them by their botanical names as well as by their common ones, and he knew their geography, history, and uses. He was, moreover, a connoisseur in the matter of fine fruits, and no garden in the country surpassed his in the way of variety or quality of culinary vegetables, and the growing of mushrooms was a specialty.

Every year he took a two to three month's vacation, and went at various times to some part of Europe, the Holy Land, Egypt, or Mexico and elsewhere, invariably visiting the public parks, botanical gardens, famous nurseries, or arboreta, and his noble, cordial, manly presence, splendid education, and love and knowledge of plants, made friends for him wherever he went. Many a seed and little plant has he brought home from his trips abroad to enrich his collection. He never visited England without visiting the Veitch's nurseries and Kew gardens; and four years ago, when Mr. Nicholson, the curator of Kew, was in this country, he was the guest of Mr. Dana for some days.

Charles Anderson Dana was born in Hinsdale, Cheshire Co., N. H., August 8, 1819, and died October 17, 1897.

"It is over 20 years ago that I first knew Mr. Dana personally and visited Dosoris, and even then he was the friend of such men as Prof. C. S. Sargent, Frederick Law Olmstead, George Such, Samuel Parsons, Dr. Thurber, and other noted botanists and horticulturists, and his love for trees and flowers, his enthusiasm and knowledge soon brought him into contact with most of the progres-

sive horticulturists of this and other countries.

"There were two gardens in Europe Mr. Dana never tired speaking about: they were Fota Island in Ireland, and Castle Kennedy in Scotland, both remarkable for their magnificent coniferous trees.

"Once a year Mr. Dana arranged for a garden party to entertain his horticultural friends, and what delightful gatherings they were! Among the guests who foregathered on these occasions were such men as Judge Addison Brown, Dr. Barstow, Dr. Britton, Sam. Parsons, Sr. and Jr.; Andrew S. Fuller, Thomas Meehan, John Saul, W. R. Smith, George Such, W. A. Stiles, Donald Nicholson, Isaac Hicks, Peter Henderson, J. R. Trumphy, Dr. F. M. Hexamer, and such like kindred spirits. And, alas, how the ranks of these have been thinned by death within the last few years.

"Mr. Dana was at his office in New York for the last time on June 9 of this year. He did not go to the city on the 10th, because he felt unwell, and on the 11th he had his garden party. We all noticed a failing change in our grand old host, and felt it keenly, but not one of us expected that that was to be the last time we should see him alive. Each of us who was there and yet survive, mourn for Charles Anderson Dana, as we would for a brother or a father." W. I.

### The Season's Vagaries.

It's a queer land we are living in now. We can gather Hawthorn in no small bits on October 20, and here too is soft bedding stuff as Coleus, Heliotrope, and the host of general summer plants looking as if they were come to stay, but would rather not, after having done the regular summer duty. But perforce, they must, when the temperature reaches 89 degrees in the shade. Cannas, who thought ten days ago, when the temperature dropped to 40, that it was time to lay me down and rest, feel now there was a slight mistake somewhere, and have once more got their eyes wide open and accepting the change are quite gay again in their summer finery, barring the slight disfigurement of worn-out clothing near the feet.

But when we drop around by the late sown Sweet Alyssum and Mignonette, we get the real sniff of early summer, and praise our great wisdom in forgetting to sow it earlier; not that any fault can be found with that sown in early summer and now past the middle age and beauty of its life and usefulness, but sweet sixteen is about the same age now as in grandmother's days, and it is not a bad thing for us to sow a little seed of Mignonette and Alyssum in any vacant spots during August, for indeed their growths seem to look even sweeter when an old brown leaf or two snuggles up to them.

Another showy thing is a border of Helichrysum sown in May—such a contrast to those from seed sown inside and planted out! Rosa Wichuraiana near by, has many of its pure white flowers expanded, while a large clump of Salvia Pinneri shows up well in the distance. The Chrysanthemums worked into spots between the shrubs are looking fine and brighten up things considerably; and farther on it is strange to see a specimen bush of Colutea halepica in full flower and still holding a number of its reddish bladder-like pods from the last crop of flowers in July.

Strolling into the kitchen garden grounds things are much the same, too, for we can see flowers on the currant bushes, ay, and even fruits but of course no leaves, and there are full-grown winter Nellis pears with a batch of younger fruits three-eighths of an inch in thickness on the same tree, while red raspberries are almost plentiful.

But we think it well to stop before the readers believe we have, in this favored spot, everything they have not, and are perfectly satisfied. Well, we are not satisfied, we want rain.

J. HOLLOWAY, Glen Cove, N. Y.

CHARLES A. DANA.

Born August 8, 1819.

Died October 17, 1897.

## Some Fungous Diseases of the Celery.

BY BYRON D. HALSTED.

### The Celery Blight, or "Rust" (*Cercospora Apli*, Fr.)

The trouble known as celery "rust" is due to a fungus bearing the name *Cercospora Apli*, Fr. This blight, as it should be termed, for there is a genuine rust of the celery, has long been known in this country. Celery plants that are attacked by this disease have their leaves at first dotted here and there with yellowish patches that soon become brown. At first the green is destroyed and then there follows the appearance of the fungus upon the surface, when it produces minute tufts of threads that are brown and bear long spores upon their tips. These are peculiar in shape and resemble that of a base-ball club, with the handle end more tapering. Those who are familiar with a billiard cue may see in the *Cercospora* spore a shape that is not unlike the cue. Some of the spores have the tips drawn out so that the whole is not unlike an ox whip when hung by its tip. The spores are here mentioned in detail as they are so different from those of any other celery fungus and the reader may understand that these blights, while quite alike in their effect upon the host plant, are very different microscopically. This while it is the leading fungus trouble of celery will not be further treated of here, as an article upon the subject has recently appeared in this journal (page 725).

### The Celery Leaf Spot (*Phyllosticta Apli*, Hal.)

This fungus was first discovered while examining the leaves for the *Cercospora*. After becoming familiar with it there is no trouble in distinguishing the two, even when growing upon the same leaf. The *Phyllosticta* differs in the nature of the spot, which begins as a dull brown patch, never becoming of the light ashy color so characteristic of the *Cercospora* in one of its stages. In the *Phyllosticta* the leaflet may be attacked only in one spot, which, continuing to enlarge, causes the whole to become brown and lifeless, followed by a torn condition. Two or three of these large, dead, shredded places may be all that the leaf contains, while the balance is healthy and deep green.

When the *Phyllosticta* was first found, the suspicion arose that it and the *Cercospora* might be genetically related, as both of these genera of fungi are considered as simply stages or forms in the life cycle of other species. With this in mind, a careful study was made of the *Phyllosticta* and *Cercospora* by means of cultures. Each reproduced its own kind in every instance. It was particularly easy to grow the *Phyllosticta* upon sterilized petioles in test tubes, and transfers were repeatedly made from pure cultures of this fungus without a trace of *Cercospora* appearing. The pycnidia would form and mature in great abundance within five days, and even upon the surface of the liquid, at the bottom of the tube, as well as the petiole itself. While the proof is all negative, it at least reduced the probability that there is any connection between the *Cercospora* and the *Phyllosticta* of the celery, except the accidental one of sometimes growing upon the same leaf, and this is an occurrence not uncommon to many other species of parasites.

### Another Celery Leaf Blight (*Septoria Petroselinifolia*, Des.)

While looking for specimens of the *Phyllosticta* previously mentioned, a blight was found in considerable quantity that proved to be a *Septoria*. This disease differs from the others, to the naked eye, in the more complete killing of the leaf affected. It has been shown that the *Cercospora* gives a spotted appearance, while the *Phyllosticta* produces an occasional large patch that is dark brown and dead. The blight now under consideration often causes the whole leaf to become brown, with small black dots scattered over the surface. A plant at all affected is quite apt to have the whole foliage diseased.

Professor Chester, of the Delaware Experiment Station, has found this species in his state and reports it as quite destructive, "causing in extreme cases a complete wilting of the leaves, and in the case of younger growths a complete destruction of the entire plant."

### The Celery Rust Proper (*Puccinia bullata* (Pers.) Wint.)

There are two true rusts of the celery as recorded in the books. The *Puccinia bullata* (Pers.) Wint., which has a wide range geographically, being found throughout Europe, North America, and Australia, thrives upon a large number of the members of the order (Umbelliferae) to which the celery belongs. Prof. W. G. Smith\* mentions it as very destructive in England. Dr. O. E. K. Zimmernann† gives six figures to this species, showing various views and stages of the fungus, and mentions a large number of hosts, including the following cultivated species: parsley, dill, and celery. Like many another fungus, its inroads may be expected at any time in this country upon our cultivated umbelliferae.

The other species of celery rust (*Puccinia Castagnei*, Thum.), should it be distinct from the one mentioned above, is perhaps confined to France, where it was discovered.

### A Bacterial Disease of Celery.

Celery fields near Greenville and Bayonne, N. J., and elsewhere have been attacked by a peculiar blight of the celery, and particularly the Golden Plume variety. The affected leaves are badly blotched with brown, the diseased spots having a watery appearance that suggested the work of nematodes (eel-worms). A microscopic examination of the infested leaves shows that while nematodes and all forms of filamentous fungi were absent, there was an abundance of bacteria uniformly in all the diseased patches. It was an easy matter to isolate these germs and grow them free from anything else, for inoculation. Leaves of celery were treated with the pure bacteria, and at the end of the third day, as a rule, the disease had spread throughout their whole extent. The germs when introduced into the core of a plant cause this tender portion to decay with greater rapidity than when placed in leaf tissue. The leaf affected turns brown and in all the dark portions abounds in germs. The central portion of a celery plant may be infested when the outermost leaf stalks decay and fall. Dark wavy bands upon the base of the outermost petiole show where the bacteria are at work, and marks the progress of the disease as it spreads through the tender substance of the celery.

It was observed that the bacteria increased most rapidly when the celery is kept constantly moist, but not submerged. Thus, stalks placed partly under water to which germs had been added decayed quickly near the surface, while the portion submerged was the last to spoil. The practical lesson from this is to keep the celery dry or else place it under pure water. That this disease is serious may be judged from the fact that a large grower has lost nearly his whole last crop, the heart of each plant melting away to a worthless mass of rotteness. The same grower has lost a large per cent. of his carrots from bacterial decay, and this suggests the probable connection between the two.

The spraying with Bordeaux and Cupram, that has proved effective against the *Cercospora* and other blights, will doubtless check the bacteria if applied at the proper time. [See last issue.—Ed.]

The above statements have been drawn largely from special bulletin Q of the New Jersey Experiment Station. New Brunswick, N. J., October 20, 1897.

## Storing Celery for Winter.

### Another Method Described.

To the Editor of American Gardening.

IN AMERICAN GARDENING of October 16 there were discussed some methods for storing celery for winter use, and in connection therewith, I would like to submit to your readers the following plan which is saving me a good deal of labor, besides being much more satisfactory.

About the last week in October I begin to take the crop up. On one side of the field I set a row of boards on edge, and drive stakes on both sides of the boards to hold them in place. Then, with a spading fork I dig the celery, taking up a lump of soil on the roots. The celery is set against the boards, and after one row is in place I draw a little soil against the roots with a hoe and proceed to put in another row in the same way and so continue the operation, until a space three or four feet wide has been filled in when another board is set up. In this way I make a bed of plants 15 or 20 feet wide.

If wide boards are not used so that the tops do not reach a few inches above the celery, another board should be placed on top of the first, and nailed to the stakes, as it is important to have an air space between the tops of the celery and the covering.

The celery will keep better if it is set in rather loosely, as it will then dry out after a rain; and I advise leaving it uncovered as long as can be safely done. When it is time to cover the bed of celery to prevent its freezing, a few boards may be placed across the bed and other boards laid lengthwise on these, leaving some opening for ventilation to be filled with straw on cold days.

The foregoing is often all the covering that is needed before Thanksgiving, and a light covering of cornstalks or some other refuse from the garden will keep out the frost until Christmas, when if it is desired to keep the celery longer, a thick covering of straw or manure may be added.

If an opening is left, and a hotbed sash placed over it to let in the light, the celery will keep longer. The sash may be covered with matting or straw during the coldest weather.

The conditions of preserving celery are keeping the roots moist and the leaves dry, having the plants a few inches apart so that they will not heat, plenty of ventilation, and protection from too hard freezing.

The same boards may be used as were used for blanching the early celery, and the celery may be stored in this way in less than one-half the time required to carry it to the cellar, or to trench it in the ground; further it is more easily taken out and prepared for market.

The outside boards should be banked with straw or manure if the celery is left out until very cold weather, and this has only to be removed to get to the celery, which comes out without any digging, and as no earth comes in contact with it, it is clean and needs no washing, thus saving a good deal of disagreeable work in cold weather.

I have not used this method for keeping celery longer than Christmas, but I think if it is properly put in and covered at the right time, and attention given to ventilation it will keep well until spring. On warm days in the winter the celery may be taken out and removed to the cellar, or a warm room and prepared for marketing as it is wanted.

W. H. JENKINS, Delaware Co., N. Y.

Frosts in some of the late grape districts of New York have resulted in what is practically a total loss. Very little of the crop had been harvested as yet, and although fires were built in different parts of the vineyards, most of the fruit was ruined.

Ellwanger & Barry, nurserymen of Rochester, N. Y., have received notice that medals have been awarded them for their exhibit of fruit at the Hamburg, Exhibition. Two of these medals are gold, two silver, and two bronze.

## The Fruit Garden.

**Raspberries and Blackberries.**—At the approach of winter weather, the tender varieties of these will need some protection. The time for doing the work depending on the locality, always waiting until there is danger of the ground freezing solid, which around New York City will not be for three or four weeks yet.

**Planting.**—There will be time and opportunity yet to continue the planting or moving of the hundred and one things found necessary in a place of any size. The work should be carefully done, so as not to expose the roots to sun or wind for any length of time. It may be well to remind some of the danger of planting too deeply; few trees will stand it. This is a very common fault, and is accountable for more deaths than all others combined. A sensible way and sure is to have a light straight rod handy to drop across the hole when setting the trees and bushes until you become accurate enough to be able to finish off a hole without covering more than an inch above the original surface mark on the trees. Another point, by which trees and time are often saved, is to always cut back or else thin out the branches of all things moved of extra size, unless a good ball of soil is attached to the roots.

**If the Fruit Picking is Done,** make a point to clean every fruit, bad or good, from the trees, especially from plums and peaches, and finish the job by then cleaning them from the ground.

**Storing Apples.**—This mild weather is very bad for apples. If they can be kept dry, outside is much the better place, provided they are where some straw or hay is at hand to be thrown over the barrels at the sign of a cold snap.

**Grapes.**—The vines are looking fine, the wood hard and brown. If the wood appear green and the foliage is beginning to drop, a sharp shake of the trellis now will help by letting more sun into the center. To get fruit, there must first be ripe wood.

J. HOLLOWAY, N. Y.

## Points in Mushroom Culture.

Will you please give me what information you can on the raising of mushrooms? We have a stone quarry on the southeast side of a large hill. It is about 200 feet long, 40 feet wide, and about 15 to 20 feet deep. Our idea was to wall up the open side with stone which would cost us nothing but digging out, also build up stone piers where needed to support the roof which we expected to be of earth about three feet deep. Would this be a suitable arrangement for the purpose? Are there any books on the methods of raising of mushrooms?—W. H. LONG.

—The quarry above described would undoubtedly make an ideal structure for the growth of mushrooms, if our correspondent carries out his ideas as he suggests by walling up the open side, and making a substantial roof which will prevent the entrance of any rain water. In order to support three feet of earth, the roof should be made very strong; this could be done with the aid of sufficient stone pillars underneath; these, if numerous, would necessarily take up much valuable space, and would, moreover, be in the way. Instead of stone pillars we would prefer to use old 4-inch greenhouse hot-water pipes. These can frequently be bought very cheaply; second-hand pipes are often offered in the florists' papers at 5 to 8 cents per foot; they can be cut to any lengths desired.

The length and width of quarry is suitable, but 15 to 20 feet is entirely too deep, and is impracticable, a depth of 8 to 10 feet is ample for all purposes. Nearby builders could suggest some method to roof this; our correspondent does not inform us on this point. A flat roof would be convenient, if large beams are laid across, with suitable supporting timbers lengthwise, and two rows of pillars running the whole length should be sufficient; we would prefer to put a layer of concrete before putting on any earth, by putting the timbers close enough to hold a layer of coarse stone; upon this a layer of cement concrete, and upon this place

the earth as suggested, but 18 inches well tamped would answer the purpose admirably. If good clay can be conveniently found, it could be substituted for the concrete, and will answer the same purpose by putting on a good layer, then puddling.

We would plant some vines on the roof (as Honeysuckle or American Ivy) to bind it together, and moderate the temperature inside; this latter is the most important point in all structures intended for the growth of mushrooms. Such a building may correctly be termed a cave, and if its exterior walls and roof were thickly covered with the vines as suggested above, it should be possible to keep the temperature in the summer down to 58 degrees and mushrooms could be successfully grown all the year round.

In Europe, especially in France, the culture of mushrooms in caves and old tunnels is an important industry. The natural heat of the earth underground being exactly suited for growing them, there is no reason why the same should not be done here equally successfully, if given the same intelligent attention. One of the best books I have ever read on the culture of mushrooms is "Mushrooms for the Million," an English publication recording the remarkable success and methods of a grower for the London market. The methods carried out there would not apply here, owing to the difference in climate. The same system applied in the cave would unquestionably be successful. The only American book on this subject I know of is by Mr. William Falconer, a well-known practical grower. I cannot speak of its merit, as I have never yet perused it; it can, however, be counted a standard work on the subject. (Either of these can be supplied by the publishers; prices respectively 50c. and \$1.50.)

If our correspondent has never before grown mushrooms he should not expect great success the first year. They are easily grown, if given the right conditions, but they will sometimes fail to grow; if some beds prove fickle, don't be discouraged, try again. I have grown mushrooms for 14 successive years both here and in Europe, without one real failure. Then a few years ago I failed utterly for two seasons, and could not grow one pound, although the same methods were practised. After a great deal of disappointment and all kinds of imaginations as to the cause of this failure, I finally proved to my satisfaction, that it was caused by unconsciously using unhealthy manure. I have frequently alluded to this point before in this paper; its importance will warrant its appearance again; it is no small matter to go to a large expense to provide suitable conditions only to be baffled by failure, disappointment and loss.

Regular horsemen like many other human beings, have an uncontrollable weakness for doctoring the horses; to make them spritely and sleek, I have known oil, arsenic, savin, and various other strange compounds given horses, also carrots, potatoes, all of which have the same effect on the mushroom bed, that is utter failure every time; manure from animals thus doctored will not produce mushrooms. Many such failures are attributed to the incapacity of the gardener when the real cause may have its origin in the other hemisphere.

Before utilizing any manure for mushroom beds, be sure and see for yourself if the horses are unnaturally sleek looking; if possible, watch how they are being fed; if anything more is given other than hay and grain, don't use the manure.

Procure manure from plain healthy horses, they may be bedded with German peat moss, leaves or straw; anything that is saturated with ammonia may be used with the droppings. Every morning as the stables are cleaned out the manure should be carried out to a suitable place to cure, and some protection from sun and rain should be given. An open shed is the place to prepare the manure. It should be carefully turned over with a fork four or five times a week, according to its condition, and should be kept warm without allowing "fire fang"; this is done until it is wholly decomposed, and the whole of a brown

color, just moist enough all through without being either wet or dry. In this condition it is ready to be made into beds.

If possible, and for convenience in working, all mushroom structures should be provided at each end with a door large enough for a cart to go right through, so that material can be carted on the spot. In such a cave a space of eight feet wide may be left to give room for the cart. In making the beds commence at one end, and make the beds in ridges 8 feet wide and 2½ feet high; a space of 2 feet may be allowed between each bed, beds to run parallel across on each side of center path, until the whole length is filled.

Do not attempt to grow these without the best spawn purchased from a reliable house. Cheap spawn may prove very expensive, and the best and freshest is surest. Permit no draughts near the beds; and spawn when the heat of the bed is declining and registers about 85 degrees. After the bed is cooled off to 70 it should be covered with two inches of good sod from a pasture. Mushrooms can be expected in six to eight weeks.

W. M. EDWARDS, Conn.

## West Virginia Horticulturists Meet.

The Horticultural Society held its annual meeting at Lynchburg, October 14, President Woods in the chair.

Prof. Wm. B. Alwood, of Virginia Polytechnic Institute, delivered an address on the "Present Status of the San José Scale," in which he stated that the first year's inspection revealed the fact that sixteen counties were infested, and in these about sixty private premises were discovered to have scale infested stock. Several nurseries were among the infested premises. The present year's work shows nineteen counties with one hundred premises infested. These cover the entire state. Prof. Alwood stated only in a few instances is the scale spreading in a serious manner, in fact, most of the cases have been so well treated as to largely check the further spread of the trouble, but in some few instances an alarming spread is still going on, and that, unfortunately, the inspector is without funds to properly execute the law. Wherever the law has been properly executed the danger is subsiding.

The discussion took a wide range and resulted in the Society fully endorsing the inspection law as it now stands and resolving to ask the Legislature for an appropriation of \$2,000 to be expended in a more thorough inspection and enforcement of the present law.

A resolution was also adopted endorsing the proposed congressional enactment to prevent shipment of scale-infested stock between the states.

Mr. J. W. Kerr, of Maryland, gave a paper on "Culture of Native Plums," which was a most valuable article. He recommended native plums very decidedly over the Japanese or European plums, and gave direction as to selection of varieties and culture.

The Society after attending to routine business elected the following officers for the ensuing year: President, Samuel E. Woods; vice-presidents, A. F. Mosby, J. B. Watkins, W. H. Boaz, W. B. Alwood, S. L. Lupton; secretary and treasurer, George E. Murrell.

A number of market gardeners and fruit growers met lately at Peoria, Ill., for the purpose of establishing and maintaining a vegetable and produce market. Having been deprived of the use of the market house that had been established over 35 years to make room for a new city hall, the men were obliged to take the matter into their own hands. The secretary would like to hear from other similar organizations. W. H. SEIBOLD, Box 702, Peoria, Ill.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

## Early or Forcing Grapery.

To the Editor of American Gardening.

It is not possible, in the limits of this short article, to go into the details of forcing grapes, nor is it necessary so to do, as the subject has lately been given publicity in your columns on several occasions. By reason of the better prices obtained for really good fruit when placed on the market either very early or very late in the season, there is now considerable discussion as to the construction of the early grapery, and this opportunity is taken to present the writer's ideas on the subject.

It will be seen by a reference to the accompanying illustration that the side and top ventilation of the suggested house is regular. The pitch of the roof is 45 degrees which is considerably more than is in common practice. The heat pipes are two-inch wrought iron, and are securely fastened to the iron posts and columns. This size of heating surface is admittedly the best, and the pipes are out of the way, and as they do not come in contact with the grapery border, they do not unduly influence the temperature of the border in places, and are not an obstruction.

The bed for the border is formed of four

can be pulled down to admit air. Then if the paneled ventilation connecting this framework with the grapery is slightly opened, the outside air will be tempered in its passage over the warm outside border, and through the heat pipes of the grapery.

The heat pipe placed along the inside of the retaining wall will assist to temper the air, and at all times allow the operator to maintain any desired temperature, and control the moisture of the border.

Concerning the superstructure of this grapery, there are many points of merit which will appeal to the mind of the professional grower, but the writer's main object is to call attention to the importance of having the entire grape plant under control. The old custom gave us control of the vine, but the root ran at will, to the great detriment of the life and usefulness of the plant. It is a well-known fact that these roots will travel long distances and to great depths, so that our ordinary borders contain little more than the main roots, while the feeding, or fibrous roots, are working in a soil unprepared for, and not congenial to them. This we have learned by digging up old vines that gave no appearance of feeding roots, and were one mass of knots, or root galls. Again under the old methods,

would be to spade out the outer or inner two-thirds of the border taking out roots and all, the other third to be removed with a spading fork (this will leave all the roots for two feet from the vine), toss the roots upwards and backwards so that all the old soil is removed, then refill the border and replace the roots as near the surface and as well apart as possible.

This lot of pruned roots will take hold when the vine is started and produce surprising results. This operation may seem radical, but remember that you destroy but 80 per cent. of the roots every second year, and the vines, if they could speak, would thank you for it.

D. E. HOWATT, Jersey City, N. J.

## Different Forms of Potash in Fertilizers.

Potash, like phosphoric acid and nitrogen, does not exist as such in fertilizers, but is held in combination by some other materials. Different substances serve to hold it and modify its properties so that it will serve as food for plants. The nearest approach to pure potash which we have in commerce is "potash lye;" the properties of this material are well

FIG. 210.—CONSTRUCTION OF A FORCING GRAPERY.

inches good concrete, thoroughly laid and finished with a smooth surface. This concrete bed is to have a fall of seven inches from the center of the grapery to its connection with the retaining wall, at the edge of the outside border. The retaining wall, which is placed about six feet from the grapery, to be an eight-inch wall as shown. The surface of the concrete bed to be connected to the outside drain by a three-inch tile leading through the retaining wall, for the purpose of carrying all surplus water from the grapery borders into the outside drain. Such tile openings through the wall to occur every eight or ten feet along the length of the border, and the location of all such border outlets to be carefully marked so that when the vines are ripe, an opening may be made through the border for the purpose of removing roots and other obstructions that would otherwise eventually obstruct the drain. The material for the grape border to be made in the usual manner and placed on this concrete bed as shown.

The sash along the outside of the grapery to be built in a proper manner, and so arranged that when pushed up they form a tight cover and protection for the outside borders. These sash can be used in bad weather to ventilate the grapery at times when it is injurious to open the top ventilation. The bottom of the frame sash can be raised up or the sash

the vines were taken up for forcing early in January, and while the vines themselves, and a few of the insid roots, were in a growing atmosphere, the outside roots, which should be working for the development of the crop, are surrounded by frozen soil, or ice-cold and moisture-laden clods of lifeless earth. Confining the roots as shown overcomes these difficulties, and many others not mentioned.

In addition to the above, it would seem but natural that the vines would flourish in new soil, rather than when forced with their roots working in a border, anywhere from five to thirty years old. To give them this new soil, I would plant the vines in the new border, and at the expiration of the third year, at the time the vines are pruned, I would remove the outside border and replace it. The second year thereafter remove that side of the inside border, and replace it with new soil. Thus making one-half of the grapery border of new material every second year. This method would enable the operator to force his vines as early and as hard as necessary, the vines remaining strong and vigorous, repaying the expenses one hundredfold.

The writer in a somewhat modified form, successfully carried out this principle of root-pruning and border-making, at a period beginning nearly twenty-three years ago.

The best way to remove the old soil

known; it is extremely corrosive in its action and unfit to be applied to the soil.

There are in Germany large natural deposits of material containing potash in combination with muriatic (hydrochloric) acid, and others in which the potash is combined with sulphuric acid. The former is the source of muriate of potash, and the latter of sulphate of potash which is used in fertilizers. The former costs less than the latter and is less valuable as a fertilizer because the chlorine which it contains is detrimental to the growth and quality of some crops. As an example, potatoes and tobacco grown with fertilizers containing muriate of potash are not of as good quality as when grown with fertilizers containing potash as sulphate.

There is no practical difference in the quickness of availability of the two forms, both being soluble in water and in a condition to be immediately taken up by plants.

For field crops such as corn, wheat, grass, clovers, etc., the muriate is cheaper and just as good. For garden crops, tobacco, potatoes, etc., the sulphate should be used.

Different brands contain potash in different forms for this reason: some are intended for one purpose where chlorine does no harm, others for purposes where it is harmful.

JOHN FIELDER.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 18, 1894.

PUBLISHED BY

A. T. DE LA MAR PUBLISHING CO. LTD.  
ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.  
Telephone, 2154 Cortlandt. P. O. Box 1897.

REGISTERED CABLE ADDRESS  
Commercial Cable) Florez, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1897, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per agate line; in "For Sale" column, 3 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

## The Henry Strawberry.

Arrangements have been made whereby a bountiful supply of these plants will be ready for spring delivery to subscribers and agents, and in this connection we beg to call the attention of our readers to our generous offer of these plants in another column. We do not think that a more liberal offer has ever been made than the one now advertised, whereby the agent or worker sending us in a club of ten new names, at \$1 each, becomes entitled to 100 Henry Strawberry plants, while five plants will be sent postpaid to each person in his club. This offer will not apply to a club of less than ten. It may be a very long time before such an offer of such a plant can be made again. The wonderful success which has accompanied our premium offer this fall, in the short time at our disposal to advertise it, leads us to believe that the orders for the Henry Strawberry next spring may exceed all anticipations; however, we have planned for a large supply for delivery and trust to be able to meet all demands upon us. Mr. Jerolaman's series of articles is now being placed in pamphlet form, and copies will be mailed free to all who desire to use same in the canvas for new subscriptions.

All the premium Henry Strawberry plants due to date, have been shipped, except where a request has been made to hold them till spring, and judging by the unsolicited acknowledgments received, they are giving immense satisfaction. In order to reduce weight and hinder excessive transpiration some of the leaves are cut off before shipping, this is especially beneficial during a hot spell, and readers can rest assured all is done for the best.

**Origin of the Ben Davis Apple.** COMMENTING upon a statement credit- ing Governor Tanner, of Missouri, with the claim that Ben Davis was raised from seed by a gentleman named Funkhouser, at Burnt Prairie, near the line of White and Wayne counties (this accounting for the synonym, Funkhouser, and which he considers the true name of the apple), the National Stockman gives the following interesting details: It must be well on to forty years since the late J. S. Downer, a careful pomologist of Todd county, in southwestern Kentucky, introduced Ben Davis to Downing, Warder and other pomological authorities. His statement was that old trees were growing in his vicinity which had evidently been sprouts, as sprouts taken from them were identical; but he did not know where the original sprouts came from. According to Warder (American Pomology, page 585) the variety was cultivated years ago—grafted trees in all probability—by Verry Aldrich, in Bureau county, northern Illinois, under the name of New York Pippin. In other sections it was called Baltimore Red, Victoria Pippin, Carolina Red Streak, etc., and also Funkhouser, as has been already mentioned.

Recently investigators in Tennessee would seem to make good the claim that Ben Davis originated in that state. At least this is the light thrown on the matter in the bulletin for May, 1896, issued by the Tennessee Station at Knoxville. The bulletin quotes from the proceedings of the American Pomological Society, in which the late Dr. W. M. Howsley, of Kansas—a pomologist of extensive knowledge—makes the statement that: "In the year 1799 William Davis and John D. Hill emigrated to Kentucky and settled in the part of Logan county now called Butler county. They located near Capt. Ben Davis, the brother of William Davis, and the brother-in-law of Hill. A few years afterward Hill returned to Virginia on business, and when he returned to Kentucky, he brought some apple grafts with him. Hill and William Davis raised fruit from these grafts. Capt. Ben Davis, finding the apple a desirable one, grafted the same for himself, as well as raised a young nursery of it. These trees were sold throughout the county, and for want of knowing any other name the people called it the Ben Davis apple. The Davis family, however, call it the Virginia Pippin."

The defect in this account, says our contemporary, is the unlikelihood of grafting being done in that section as early as the beginning of the present century. It is well known that the Dyehouse cherry, which originated in central Kentucky about 1825 perhaps, was for thirty years or more multiplied by sprouts dug up from the original tree and taken into the adjoining neighborhoods, and that it is only in recent years that it has been budded and grafted. If the term 'grafts' above could be taken to mean 'sprouts' (as Mr. Downer has it) the history would be clearer.

A somewhat different statement is contained in a letter from J. C. Hodges, of Hamblen county, Tennessee, vice-president of the East Tennessee Horticultural Society, and which is copied into the bulletin previously mentioned. Mr. Hodges

writes: "During most of the first half of the present century and up to 1860, or thereabout, there lived on Nolichucky river, within this (Hamblen) county, a wealthy farmer whose name was Ben Davis. His son, B. A. Davis, resides now at White Pine, Jefferson county, Tennessee. On the farm owned by Ben Davis originated the apple in question. From the original tree others were propagated, and for many years before the death of Ben Davis he raised and harvested large quantities of these apples. The house of Ben Davis was on the great stock route from Kentucky to the Carolinas. Many drovers made it a point to stop with him in going and returning from the South. It was his custom to supply their saddlebags with these apples, especially on their return trips. There was no name for the apple known to them, so they called it the Ben Davis. Grafts or clones were taken to Kentucky and the apple was propagated and disseminated there before it was in Tennessee. I have obtained these facts on personal inquiry from the son of Ben Davis above mentioned. And besides, these facts are well known in the neighborhood among the older people."

It would be of public interest if any further light could be thrown on the origin of this apple, and our readers are invited to add any information they may be able to give.

We wish it to be distinctly understood that no notice whatever can be taken of unsigned communications. This will be an explanation to some correspondents who have not received any reply to their questions.

## Marketing Farm Produce.

The scope of this latest farmers' bulletin issued by the U. S. Department of Agriculture (No. 62, Marketing Farm Produce, by George G. Hill, formerly manager and editor of the American Farmer, Illinois, pp. 28, figs. 7) does not include a discussion of the present conditions of the trade, but, taking the trade as it is now constituted, aims to give to producer and shipper the benefit of such information as a careful study of the situation at the market end indicates they badly need.

The success of the average farmer, being dependent upon an aggregate of small profits, is probably more threatened by the careless manner in which his produce is packed than by any other one thing, as the expected profit may be turned into loss by the imperfect or improper condition in which an article reaches market, when if proper care had been exercised, or judgment used, there would have been a prime article offered for sale, and perhaps a handsome net profit, instead of a demand for money to pay freight bill returned to the shipper.

The bulletin, after giving a description of the trade, general rules about packing, and an exposition of the commission merchants' position, goes into the detail of particular directions for packing various kinds of produce, and can be secured free of charge by sending a request to the Secretary of Agriculture, Washington, D. C.

The full contents are: The trade in farm produce; general rules; packing; the commission merchant; particular directions; butter, eggs, poultry and game, meats and potatoes, small fruits, vegetables, and honey.

**Died.**—At the Charterhouse, London, Eng., as the result of a street accident, Peter Lund Simmonds, aged 83 years. Mr. Simmonds was the author of several encyclopedic works in connection with the uses of plants and plant products; he also compiled voluminous statistics regarding their commercial importance, and was the author of Tropical Agriculture.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**Washing Strawberries.**—Mr. Jerolaman speaks of sandy strawberries being washed. The only successful way I ever tried was to take a common screen sieve with mesh about one-eighth to one-quarter inch, and tack it to convenient sized frames made of 1x2-inch slats. Carefully pour the berries on the sieve, one layer thick, and while one person pumps, the other keeps moving the screen in such a manner as to allow all berries to come under the pump spout; by having a number of screens made, the berries can be allowed to drain before being placed in boxes. Washed berries should never be shipped, and enough mulch should always be used to give the gloss to a berry instead of having to wash it. Washing berries, no matter how neatly done, never gives full satisfaction to either the grower or the consumer.—C. C. N.

**Sow Bugs.**—In your issue of October 16, page 717, W. F. Preston, Ill., inquires how to get rid of sow bugs. Take Paris green and mix with sugar until same shows green color. In the evening put it near the place where the bugs lodge and in the morning it will be eaten. Should there be any sow bugs left, repeat the process. Sow bugs certainly eat young plant growth, and they are especially fond of Violet buds, and if our entomologists will not believe it, they ought to try by putting a handful of sow bugs in a Violet bed. It will save them the trouble of picking Violets.—N. BUTTERBACH.

—On page 717 of your issue of October 16, W. F. Preston inquires about the sow bug, and it is stated the entomologists claim they do not eat. In preparing soil for my greenhouse I worked a lot of them into the dirt through the manure, and as soon as my cabbage, lettuce, or Pansies came up they began to eat them. As I had to fire up at 10 or 11 P.M. sometimes I had a good chance to watch them. On going from the furnace room I have seen them scamper off leaving fresh cut plants. I tried Slug Shot without effect. I expect to try dusting and spraying with Paris green. Can we fumigate with anything that will kill animal and not plant life?—C. E. K.

—On page 717, Preston asks about sow bugs. Entomologists may be O. K. in theory, but facts show differently. The sow bug cost me more than one hundred dollars on my greenhouse crop of cucumbers last spring. They gnawed the bark off the vines and attacked the young cucumbers, and eat them up until the cucumbers outgrew them. They go down in the ground daytime and come up and work at night, but I caught them at work both night and day. I kept them down some with slacked lime. I shall use both lime and tobacco tea this next crop if they bother again. I am quite sure the tobacco will fix them if strong enough.—J. J. THOMAS, Colo.

**Remedy for Poison Ivy.**—I have noticed in recent issues quite a number of receipts to kill Poison Ivy. Here is a simple and with most people a sure remedy: Sweet spirits of nitre. Apply whenever itching begins, or at least three or four times a day. I hope this may be a boon to some sufferer.—C. E. K.

**Specimen Trees Suggested.**—There is quite a long list of desirable ornamental trees that would answer the purpose indicated by the inquiry of South Michigan, p. 715. There are, however, few trees that would "draw the attention of passersby" as would a Magnolia Soulangiana while in bloom. It grows 20 to 30 feet high, spreading round top, should be kept low. Also wants the protection of leaves about the roots and evergreen branches to shade the top the first two

winters. The double flowering Crab is very showy and attractive. Of the Maples, Wier's Cut Leaved and Schwendler's Purple Leaved are the most showy. Salisburia (Maiden-hair tree), from Japan is not beautiful, but attracts attention, being so different from our trees. Paul's double-flowering Thorn is a very desirable small tree. Birch, Cut-leaved Weeping, is very graceful and unsurpassed in beauty. Catalpa speciosa, large leaves, showy.—C. D. ZIMMERMAN, N. Y.

**Cheap Greenhouse Glass.**—Possibly some of the readers of AMERICAN GARDENING would build a greenhouse were it not for the expense of glass. If they will go to their photographer, they will be able to get old negatives, 8x10 inches, for about \$1 a hundred. They can be easily cleaned by soda and warm water. They make the best of glass for the purpose, being free from defects.—COLUMBUS.

**Blanching Celery.**—I find one of the nicest ways to blanch celery for fall use is by using paper. I use "The Best" Red Rope Roofing, manufactured by Fay Manilla Roofing Co., of Camden, N. J., which can be bought for one cent a square foot. Cut it into pieces 18 inches square, wrapping it around each bunch and tie with a string, selecting the best bunches, and you will have the best all the time. The papers can be raised up to see when it is blanched enough, replacing them on others through the season. When through using them in the fall, put them away, and they will last many years. For the idea I am indebted to my friend Branson, who has his ad. in this journal.—COLUMBUS.

**Rhododendrons.**—Will some of the readers living in Louisiana write something of their treatment of Rhododendrons? I have bought plants several times, and friends have sent me fine plants, but I have never succeeded in keeping one long enough to see it bloom. I have used wood's earth, rotted soda and river sand, digging out all the other soil, have tried in sun and shade, but always to fail. It is the same with Azaleas, except the native ones. I have taken AMERICAN GARDENING a number of years and never find it lacking in good things, still I do wish some wise Southern folks would write an article for it once in a while. I am an old woman of sixty, and find time to scratch.—MARGARET E. CAMPBELL, Louisiana.

Fruit dealers in Chicago have to keep a sharp lookout for their safety. Recently Justice Gibbons signed warrants for the arrest of twenty-eight fruit dealers in South Water street. They are charged by the health department with violating the city ordinance which requires fruit to be of uniform size in all baskets, boxes, and barrels, and makes it illegal to cover fruit with any kind of netting.

More lay nonsense.—"Nature will have to hustle if she's going to keep up with the modern horticulturist. A Maryland fruit grower has succeeded in raising peaches this week with skin like that of apples, and next season he intends to grow a peach with a skin that can be removed like that of an orange." The foregoing is from a Maine Journal. Who is it that sends such paragraphs to the papers?

Local variations.—It is a queer country where one has half a dozen different climates in his back yard, so to say. And the joke of it is, one is always discovering others. In fact, the farmer and fruit grower are obliged to make a special study of their individual climatic conditions to obtain the best results. In the cultivation of flowers the peculiarity is even more marked.—In November Lippincott's.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

## The Vegetable Garden.

**The Fall Work.**—The season is now so far advanced that it is necessary to have all crops secured from frost, by placing them in a cool cellar, or they may be pitted outside. The best and simplest method to keep roots in good condition late into the spring, is by the use of any ordinary barrels, partially sunk into the ground, thus forming nice cool pits. Into the barrels so placed, and in a sheltered situation in the garden, lay the roots closely and compactly until the barrels are full; if the interspaces are filled with fine sand, so much the better. Such roots as carrots, salsify, turnips, parsnips, horse radish, beets, will keep in good condition a long time, if they are covered securely from frost. Do not be in too much hurry to cover heavily in the fall; give covering only when frost occurs, and as cold weather approaches put on enough to keep out the frost. When they are eventually covered for the winter, they should not be disturbed until needed for use.

**Parsnips** keep much better if left where they grew and heavily mulched. The required number of rows needed for winter use should be covered deeply with leaves and coarse litter so that they can be dug up readily when wanted in hard weather.

**Cabbages** are very easily kept through the winter, if merely pulled up by the roots and laid in rows of about three for convenience. Put them heads down, roots up, as close together as they can be laid; then cover with soil dug up from each side, putting on about 10 inches, higher in the middle to make it ridge fashion, so as to shed off the water. The whole may then be covered with a mulch of coarse litter, to prevent the frequent thawing and freezing from alternating too quickly. Otherwise they will not keep well.

**Leeks** can be earthed up in much the same way as celery, and stored in a similar manner. If they are earthed up where growing, they will generally keep well by covering them over with some coarse material.

**Brussels Sprouts.**—In very cold latitudes these could be dug up with good roots, and planted quite thickly together in batches of about five rows each, covering them over with leaves, litter or salt hay, but not before settled cold weather. They keep admirably in cold frames or cold graperies, in which case they should also be covered over with hay to prevent too much sun heat from rotting them.

**Rhubarb and Sea Kale.**—Dig now old clumps for winter forcing, leaving them out to the action of frost and they force better; they should not, however, be permitted to freeze solid, as when needed they cannot be conveniently handled. A few good roots of these placed in heat every two weeks will give constant supply.

**Horse Radish.**—Dig this up before ground freezes hard; the thick pieces can be used for culinary purposes, and the small roots of ¼ to ½ inch in diameter will make excellent slips to set out in the spring.

**Asparagus** tops should be cut and left where dropped. Scatter a little of anything that will quickly burn, as dry weeds, leaves, or straw, then set fire to the whole, endeavoring at the same time to cover all the bed with fire for at least a few minutes. This is to destroy the spores of asparagus rust.

**Pole Beans** will now be over. The poles may be pulled up and stood on end in some out of the way place until needed again next spring. Quite frequently when these beans are frozen, there are many fine pods on the vines; if these are not required for immediate use, they should be left upon the vines, and these in turn can be put anywhere out of the reach of frost. The beans if left thus will keep fresh for several weeks.

W. M. EDWARDS, Conn.

## There is Not a Home in the Land

But calls for a yearly Calendar.

Every family tries to get one or more; generally more.

## There are Calendars and Calendars

Some are good, some bad, most of them indifferent.

## There Will Not be a Calendar Issued for 1898

To exceed in artistic elegance, finish, beauty of designs and effective coloring, the one we ~~to-day~~ offer as a premium to every subscription to **AMERICAN GARDENING** received before December 31, 1897.

# EVERY SUBSCRIBER IS ENTITLED TO ONE

AND CAN EASILY EARN TWENTY.

OUR magnificent **Rose and Girl 1898** six sheet **Art Calendar**, two months to a sheet, each sheet  $8\frac{1}{2} \times 11\frac{1}{4}$  inches, is superbly lithographed in eleven colors, and printed on hammered paper; the whole tastefully tied with silk bow—undoubtedly a work of art fit for the most elegant home, and as handsome a Calendar as was ever published. Each one of the six designs presents a distinct type of female loveliness and a fresh study in roses, the coloring on each sheet being rendered in harmony with the design. There is not a line of advertising on the Calendars to detract from their value. They will not be sold by us for less than \$1.00 each.

### Who is Entitled to a Calendar?

**EVERY SUBSCRIBER** renewing before **December 31, 1897**, enclosing Five Cents additional to pay packing and postage.

**EVERY NEW SUBSCRIPTION**—To induce people to test the value of **AMERICAN GARDENING** we will send the Calendar absolutely free to every name received direct not previously on our mailing list. Remit \$1.00 for A. G. 12 months.

**EVERY ONE** sending us a club of Four 3-month trial subscriptions at twenty-five cents each, will get a Calendar, free as a premium, by return mail.

**EVERY NEW name sent in by an agent.**

NOTE.—We have ordered manufactured for us a large stock of these superb Calendars in the endeavor to have sufficient supply for all demands, but will not guarantee to fill orders after supply is exhausted. Therefore, order yours now.

**Special to Agents** A copy of our Art Calendar to show people will clinch the argument and obtain the subscription. Bona fide Agents will be mailed one copy, securely wrapped, on receipt of only Twenty-five cents (one-fourth its value.) Armed with this superb Calendar we misjudge human nature greatly if any ordinary mortal cannot secure a big list of new subscriptions every day. Every new subscriber you send us gets a Calendar by return mail.

### We Pay Agents

Every new subscription at \$1.00 entitles the agent to **Five of the Wonderful Henry Strawberry Plants**, to be delivered next Spring. Thus 100 new subscriptions would secure agents 500 plants; a possession worthy of your consideration. Every new subscriber taken by agent will receive one of our Art Calendars free by return mail.

Agents who do not want the Henry Strawberry Plants can retain as their payment **20 cents in cash** on each subscription they take, or will be credited **twenty-five cents** on any book, magazine or publication they wish to obtain through us.

Address all  
correspondence

**AMERICAN GARDENING, P. O. Box 1697, New York.**

REMIT BY P. O. or EXPRESS MONEY ORDER—IT IS SAFEST.

## The Horticulturists' Lazy Club Once More.

With the beginning of another collegiate year, the Horticulturists' Lazy Club, which was such an interesting feature of the horticultural department at Cornell last year, renewed its former activities. To say that the interest was renewed would hardly be to accord with facts, since that has experienced no waning even during the summer vacation. A half-dozen or so of those who have always been in the habit of attending the meetings, spent the summer about the University, and each Monday night during the vacation they met at the club room and there discussed some question or talked over some problem which had presented itself. The attendance was, of course, small, as compared with the number which attends during the term, yet the interest in the meetings was in no wise abated, and it may not be inconsistent to say that since the opening of the fall term a year ago, every Monday night has found enough members present at the club room to hold a meeting.

Since the present term began, which was about the middle of September, the meetings have been well attended, and while numbers are not essential to a successful meeting, yet a good large company is conducive to enthusiasm, there, as well as at most other assemblies.

### Analyzing the Sugar Beet.

At the meeting of September 11, the experiment station chemists, Mr. Cavanaugh and Mr. Kinsely, explained the method of analyzing the sugar beet. As it is very largely a mechanical process the various pieces of apparatus used in making the determinations were brought into the room and a beet was analyzed, each step in the process being fully explained, thereby clearly demonstrating the entire process.

While a subject like this is not, strictly speaking, a horticultural subject, yet on account of the prominence of the sugar beet question at the present time, such a topic is a pertinent one even to horticulturists.

### Some Old Horticulturists.

The subject of the last meeting (September 18), was a biographical one. Several members of the club had looked up something concerning certain "old patriarchs" of horticulture who lived during the last of last century and the first of this, and at this meeting there were given short biographical sketches of the lives and work of four men who exerted a powerful influence in their time. Their names were: Thomas Fessenden, Thomas Bridgeman, Grant Thorburn, and William Cobbett.

The average horticulturist of to-day little appreciates the part which these men, with many others, have played in shaping the course of horticulture in America, and it is a lamentable fact that so little effort is made to become enlightened in this phase of our horticultural history.

H. P. G., Ithaca, N. Y.

Florida's orange crop for 1897-'98 will soon be going forward to market, and a good many estimates are being made as to what the crop in the state will figure up. Last season it amounted to about 125,000 boxes. That was the first year's fruit after the freeze, and the crop was accordingly very small, especially when it is recollected that the product of the state had been numbered in millions rather than in thousands of boxes. A careful estimate made by a gentleman who is well informed, places it in round numbers at about 200,000 boxes.

**English Nursery and Seed Trade.**—We are in receipt of a copy of Wynne's newly issued "Nursery and Seed Trade Postal and Telegraphic Address List for 1897." This is a useful and reliable list in three sections: General, Telegraphic, and London Trade, and cannot fail to be of use to those having dealings with the trade in the United Kingdom. The book can be had for 50c.

## Questions Answered.

Our Inquiry Department is a Bureau of Information, to which subscribers can apply freely for advice on all subjects in the field of horticulture.

\*• We cannot undertake to reply by mail.

### Spring or Fall Planting.

I expect to transplant a lot of old shrubs this fall, half being Altheas. Please state if fall or spring is the most suitable time for it to be done.—J. H. C.

—There is but little to choose between either fall or spring; our own preference always goes toward fall planting when possible; there is more time then.

### Lettuce in Hotbeds.

Can lettuce be profitably grown in winter in hotbeds, running hot-water pipes through the beds?—H. C. C. M., Conn.

—Fully good results may be obtained, but as to whether it would be profitable is quite another matter. Frames are apt to cause damping, etc., unless very carefully handled. A frame unlike a house is dependent upon the weather as to ventilation, etc.

### Wintering Hydrangeas.

How should I treat a Hydrangea Otaska that finished blooming in August?—H. C. M., Conn.

—Store in a dry cellar or barn and keep partially dry. In the early spring cut away the old flowering heads and new growths will break out from below.

### Bigonia venusta.

I have one placed in ground under bench in greenhouse which last year bloomed profusely. This year with same treatment it has grown very large, spreading all over roof, but not a single blossom has it had. What can be done to make it bloom?—M. W., New Jersey.

—Possibly the plant has been growing a little too vigorously and has thus failed to ripen up. There is a good chance of its flowering freely next season.

### Wood Shavings and Mushrooms.

Do you believe that the use of shavings from a planing mill, for bedding, renders the horse manure unfit for mushroom raising? Of course I shake out the coarse stuff.—J. L.

—Wood shavings of any kind in manure used for mushroom growing cannot fail to be injurious to the spawn and have its effect upon the crop later. Some growers go so far that they will not use such manure under any circumstances, neither will they if sawdust has been used in the bedding. We do not go quite so far as that. But on the other hand, we would certainly prefer to have the manure free from either.

### Linnæus Rhubarb is the Best.

Is there any earlier and better variety of rhubarb or pie plant than Linnæus? If so, what is it?—W. H. W.

—It is the earliest and best on the market for all-round purposes.

### Chrysanthemum Lists.

I am interested very much in your journal, and also in Chrysanthemums, and would like if you would, at some early date, furnish a list of Chrysanthemums with height of growth, time of blooming, color, and shape of flower. I think the same would be of great interest to a number of readers, as not one of the catalogues which I have consulted gives the time of flowering nor height of growth.—W. C. L.

—This subject was treated upon thoroughly one and two years ago in AMERICAN GARDENING. However, in a short time after we have completed making our notes on the behavior and character of the varieties now in bloom and those following, just such an article as suggested will be published.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

**The Free Seed Humbug.**—The government contract for the supply of seeds for free distribution has been awarded to Henry Phillips Seed and Implement Co., of Toledo, Ohio. There were 42 bids ranging from \$69,000 to \$144,000. How much longer will this fraud be tolerated?

We solicit from our readers notes of experience and observation. While our space is limited we will always manage to make room for any communication that contains germs of real, practical value to fellow-subscribers.

## Business Cards.

O. D. Zimmerman, Buffalo, N. Y. Horticulturist Landscape Gardener. Plans and estimates furnished

LAND DEVELOPMENT, consultations, plans, superintendence, plants, labor, etc., supplied for work as wanted. 500 original designs for residences, gardens, parks, etc., ready for inspection. Communications solicited from those who require the value of land or residence developed with practical economy. Jos. Forsyth Johnson, P. O. Box 1297, New York City.

## Situations Wanted.

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

GARDENER. English, married, no children, wants charge of lady's or gentleman's private gardens; prudent, strictly temperate, disengaged Oct. 27. D., Eldred, Sullivan Co., N. Y.

SITUATION wanted, by competent gardener on private place, 22 years experience; for further reference apply to James C. Clark, Supt. Seawanhaka Greenhouses, Oyster Bay, N. Y.

SITUATION wanted, as gardener; life experience in all branches, greenhouses, grapes, fruits and vegetables; 45, married, no family. Protestant. Address, P. H., Norwich Town, Conn.

COMPETENT hothouse operator desires position with responsible parties, having extensive range; experience with mushrooms, cucumbers, tomatoes, and ordinary crops. "Hothouse," care American Gardening.

SINGLE young man desires position as foreman in private or commercial place; good experience in all branches; 12 years' best references from leading nurseries in Europe and America. Address F. A. J., care American Gardening.

WANTED. position as head gardener and manager of private place; thoroughly versed in all branches of horticulture and landscape work; accustomed to the management of help. 25 years' experience. References. H. J. Smith, Millbrook, N. Y.

## WANTED.

[Rates, etc., same as in "For Sale" column.]

WANTED to buy novelties in flower seeds and specially choice strains of florists' flower seeds, etc., to introduce in Australia. Give references when writing. Fred. C. Smith, Seedsman, Auguston, So. Australia.

## FOR SALE.

Advertisements not to exceed eighty words will be inserted under this heading at TWO CENTS PER WORD each insertion, payable in advance.

The address will be charged as part of the advt., and each initial, or a number, counts as one word. No cuts or display type allowed.

RASPBERRY and Strawberry plants. Chas. C. Nash, Three Rivers, Michigan.

GLASS at wholesale, rock bottom prices. Also paint for greenhouses. The Reed Glass & Paint Co., 456 W. Broadway, New York.

L. C. BOBBINK, Rutherford, N. J.—Dutch Bulbs, Clematis, Magnolias, Rhododendrons, Azaleas, etc. Branch of the Horticultural Company, Boekoop, Holland.

TO LET, \$100: fine truck or garden farm, 12 acres adjoining shore; warm fertile soil; one hour out; daily boat; good big house; barn. S., Room 705, 56 Pine St., New York.

DIRECT from the grower, duty free. Hulsebosch Brothers' Seed, Bulb, and Plant Catalogue is now out, prices very reasonable, anybody who has not received a copy should address Hulsebosch Bros., Englewood, N. J.

CELERY blanched with paper tubes and grown by a little boy; outold all others on the Syracuse market Saturday the 23d. Full information with photo. of second crop. Price one dollar. Richard Branson, Box 451, Syracuse, N. Y.

CALIFORNIA Privet make the finest ornaments! hedge, and are perfectly hardy. Fine large plants grown at seashore, two years old, \$5 per hundred. Cash with order. References, First National Bank, Asbury Park, N. J., State Banking Co., Newark, N. J., Atlantic Coast Nursery, James H. Cornell, Proprietor. Office, 606 4th Ave., Asbu y Park, N. J.

**PRIVATE GARDENERS.****Appointments and Doings.***Gardeners and others knowing of recent  
appointments and movements are requested to  
forward particulars of the same for publica-  
tion in this column. No charge is made.*Mr. Pettigrew, Superintendent of  
Parks, Boston, Mass., is at present on a  
tour of inspection to the park systems of  
other cities.John N. Hauser, said to have been the  
oldest florist in New York City, died on  
Sunday, October 24. He was born in  
Bavaria in 1816, and after an education  
in Leipzig, Vienna, and Paris, returned  
to his home. Before he was 25 his repu-  
tation as a horticulturist was such that  
the post of landscape artist at the Impe-  
rial Palace at Paris was offered to him.  
This post he held until 1844, when he  
came to this country, and, in partnership  
with Eugene Ball, a former Parisian and  
an old friend, started a greenhouse busi-  
ness on what was then the old Bloom-  
ingdale road, at a place which is now  
Fiftieth street and Broadway. Three  
years later the firm was dissolved, and  
Mr. Hauser went into business at Twen-  
ty-eighth street and Third avenue.**Boston, Mass.**The following were the awards by the  
Massachusetts Horticultural Society at  
the exhibition on October 16:For plants—Gratuities, John L. Gard-  
ner, display of Orchids; J. E. Rothwell,  
display of Orchids; Mrs. A. O. Simes, col-  
lection of wild plants.For flowers—Chrysanthemums, six  
blooms, distinct named varieties, James  
L. Little; second, Robert Laurie; third,  
J. W. Howard; Ten blooms of one var-  
iety, long-stemmed, in vase, Robert  
Laurie; second, the same; third, J. W.  
Howard. Gratuities—J. H. Leach & Son,  
Ivory Chrysanthemums; C. E. Richard-  
son, tuberous Begonias; James Comley,  
display; Mrs. E. M. Gill, display.For fruits—Gratuities, Elbridge Tor-  
rey, Sheldon pears; William C. Clapp,  
Sheldon pears; S. S. Crosby, quinces; F.  
W. Damon, Iowa grapes.For vegetables—Gratuities, Mrs. E. M.  
Gill, lima beans; W. Heustis & Son, celery  
and cucumbers.**Philadelphia, Pa.**The improvement about the grounds of  
the University of Pennsylvania is still  
going on. During the past weeks a large  
amount of shrubbery has been planted  
about the lawns and College Hall, and  
arrangements have been made in the bo-  
tanical gardens for the planting of a large  
variety of bulbs recently received from  
Holland. A new building 60 feet long  
and 28 feet wide for the accommodation  
of the large collections of palms now at  
the botanical gardens is under the course  
of erection.Several men employed about Horticul-  
tural Hall in Fairmount Park, are nursing  
very sore hands, and one of them is just  
sure that he is out of danger from blood-  
poisoning from stings received in hand-  
ling prickly cactus plants. All summer  
the tall, slender cacti have stood with  
soldierly erectness in a bed at the east  
end of the hall. When frost threatened  
the head gardener gave orders for their  
removal into winter quarters, and the  
men having the job, went about it with-  
out the usual precaution of wearing buck-  
skin gloves. They were stung in many  
places by the needles that bristled from  
the stalks, but, as the pain at the time  
was not great, they kept at the work  
until all the Cacti had been housed. A  
few hours later their hands began to puff  
up and soon swelled to ungainly propor-  
tions. They suffered intensely for several  
days.**New York.**The floral part of the great horticul-  
tural exhibition at the American Insti-  
tute Fair, Madison Square Garden, has  
since our last issue improved greatly.  
Excellent it has been, during the previousweeks, the fifth week eclipses all others  
for quality and general display; Chrysan-  
themums, of course, predominating.  
Several years ago it was supposed the  
limit was reached for quality and size in  
these, and that was gained at exhibi-  
tions held in November. At that time  
early flowering varieties were considered  
too small for exhibition purposes, but at  
the cup contest on Thursday, October  
21, and again on Monday of this week,  
blooms equal to anything ever seen in  
this city were staged. The National  
Chrysanthemum Society deserves credit  
for the encouragement given to early var-  
ieties by the gift of silver plate for the  
best six varieties, six blooms of each.**The Cup Contest.**The earliness of the season prevented  
several exhibitors, who had intimated  
their intention of competing in this con-  
test, from carrying out their desire; five  
of such sent in notice at the last minute  
of their inability to complete their set.  
Only three exhibitors materialized—John  
N. May, Summit, N. J.; Mr. Hobart M.  
Park (gardener, W. H. Harvey), Port  
Chester, N. Y.; and A. Herrington, gar-  
dener to Mr. H. McKay Twombly, Mad-  
ison, N. J. These competitors, however,  
made a grand showing, considering the  
early date. The cup went to A. Herrington  
with the following varieties: Miss  
Georgienne Bramhall, Vivand-Morel,  
Mrs. Henry Robinson, Ethel Addison  
(English), Major Bonaffon, and May-  
flower. The blooms were generally  
larger and possessed more body and stem  
than the second prize lot, which came  
from Mr. May, whose flowers, though,  
showed remarkable chasteness and  
beauty; and it is rare that six fresher or  
better bred blooms are shown. His vase  
of Evangeline will long be remembered as  
one of the most exquisite exhibits. Henry  
Hurrell was also very strong; Sunrise  
and Nemesis were his weakest vases. Mrs.  
Robinson also lacked the size of his  
rival's. Mr. May was awarded the  
Medal of Merit of the American Institute.  
Mr. Park came third with the following  
sorts: H. L. Sunderbruch, Iora, Sunrise,  
Australian Gold, W. Simpson, and Mrs.  
Henry Robinson. This gentleman's  
blooms were uniformly good, but failed  
to average up in the totals. Mr. Park  
received the American Institute Diploma.On Monday, October 25, the contest  
was renewed and in greater force. The  
class for five varieties, six blooms of each,  
brought three strong competitors, only a  
very few points dividing first and second.  
A. Herrington was again first with  
Major Bonaffon, Vivand-Morel, Frank  
Hardy, Mrs. Henry Robinson, and Miss  
Georgienne Bramhall. Messrs. Dail-  
douze Bros. were second with a grand  
lot, but having failed to get their Mrs.  
Trainor L. Park ready in time threw  
them out, and their Mrs. H. Robinson  
was not equal to Mr. Herrington's mon-  
sters of the same variety. Mr. J. N. May  
followed with the same exquisite chaste  
kinds as he had put up previously.For three vases Mr. Herrington was  
again first and Dailledouze Bros. second.  
For 12 distinct blooms shown singly,  
W. Duckham, gardener to D. Willis James,  
Madison, N. J., was first with a marvel-  
ous lot. His varieties were Lady Lyon,  
Playfair, Gladys Vanderbilt, Philadel-  
phia, Iora, Mayflower, H. L. Sunder-  
bruch, Mrs. J. Peabody, Charles Davies,  
Miss Helen Wright, Modesto, Miss Geo-  
rgienne Bramhall, Mrs. H. Robinson.  
Dailledouze Bros. were second.The best vase of yellow again brought  
Major Bonaffon and Mrs. Trainor L.  
Park in competition, and the new aspir-  
ant to public favor had to lower its col-  
ors to the older kind. If it had been  
judged on the second day the awards  
would have been reversed, for Mr. Her-  
rington's winning lot failed to keep up  
and expand as did Mr. Asmus' Trainor  
L. Park.For the best white Mr. Herrington was  
again first with the six best Robinson in  
the show; G. H. Hale was second with  
Mutual Friend.Dailledouze Bros. secured first for the  
best pink with Mr. Hale second. For any  
other color Robert Laurie, gardener to  
Cornellus Vanderbilt, Newport, R. I., was  
first with his new variety Peter Kay.  
A remarkable feature about these six

wonderful blooms was that they were the same six that had been certificated by the Chrysanthemum Society on the previous Saturday. The blooms keeping in such a manner that they were good even four days later.

Pompons and hardy kinds were exhibited by A. D. Rose, Jersey City, and J. G. Aitken, gardener to M. R. Cook, Esq. Bayonne, N. J., Mr. Rose securing first with the largest display.

Julius Roehrs, Carlton Hill, covered the entire stage 400 square feet, with a most charming group of Palms and other foliage plants aided by a few Chrysanthemums to give color effect. It is seldom that such a well-arranged lot of plants and of such quality is seen in an exhibition. The Medal of Superiority which was awarded seems almost inadequate for such a grand lot.

Mr. Herrington also deserves more than ordinary notice for a table 6x13 feet, which he covered in a masterly manner with Orchids and Ferns. He easily won the Medal of Excellence which was the award for the winning lot. George Savage, Rochester, N. Y., exhibited a new Cypripedium named Anna Savage, which received a first-class certificate, a description of which together with the Orchids in the above named will be held over till next issue. The F. R. Pierson Co., was again first for Beauty and Meteor Roses, thus winning four times consecutively. J. N. May, L. M. Noe, and J. H. Taylor were the principal prize winners in other classes. Carnations were well shown by Dalledouze Bros., H. Weber & Son, Oakland, Md., and G. Smith, Orange, N. J.

### Coming Exhibitions.

Sept. 27 to Nov. 4—NEW YORK: American Institute (Horticultural Section), Madison Square Garden. James W. Withers, Box 1897, superintendent.

Nov. 2-5—BOSTON: Massachusetts Horticultural Society, Horticultural Hall. Robert Manning, secretary.

MILWAUKEE, WIS.: Florists' Club, Lincoln Hall. A. Klokner, manager.

Nov. 3-4—MORRISTOWN, N. J.: Morris County Gardeners' and Florists' Club, McAlpin's Hall. W. H. Thomas, Convent Station, N. J., secretary.

Nov. 3-5—FORT WAYNE, IND.

FREDERICK, MD.: Frederick Co. Horticultural Society.

POUGHKEEPSIE, N. Y.: Dutchess County Horticultural Society, Armory. Wallace G. Gomersall, Fishkill-on-Hudson, N. Y., secretary.

Nov. 3-6—INDIANAPOLIS, IND.: State Florists' Association of Indiana, Tomlinson Hall. R. A. McKeand, Garfield Park, secretary.

Nov. 4-6—NORTHAMPTON, MASS.: Northampton Horticultural Society, City Hall. E. J. Canning, Smith College Botanic Gardens, secretary.

NEW BEDFORD, MASS.: Gardeners' and Florists' Club, Adelphi Rink. A. J. Fish, secretary.

Nov. 5 and 6—PORTCHESTER, N. Y.: The Westchester County Gardeners' Association, Fehr's Opera House. A. Grierson, Rye, N. Y., secretary.

ANDOVER, MASS.: Florists' and Gardeners' Club, in Town Hall. J. D. Fairweather, P. O. Box 597, secretary.

Nov. 9-11—SYRACUSE, N. Y.: Central New York Horticultural Society, in the Alhambra. D. Campbell, secretary.

WORCESTER, MASS.: Worcester County Horticultural Society. Adin A. Hixon, Worcester, Mass., secretary.

Nov. 9-12—MT. KISCO, N. Y.: Bedford Flower Club, under management of Westchester County Horticultural Society, Opera House. H. Spavins, Box 52, Secretary.

Nov. 9-13—CHICAGO: Horticultural Society, Armory, Lake Front. W. N. Rudd, Room 202, 185 Dearborn street, manager.

PHILADELPHIA: Pennsylvania Horticultural Society, Horticultural Hall, Broad street. David Rust, secretary.

Nov. 10-12—SPRINGFIELD, MASS.: Hampden County Horticultural Society, International Chrysanthemum Exhibition. William F. Gale, 381 Main street, manager of exhibitions.

WACO, TEX.: Waco Floral Society. Mrs. M. B. Davis, secretary.

Nov. 10-13—LOUISVILLE, KY.: Kentucky Society of Florists. F. C. Haupt, 241 W. Jefferson street, secretary.

TORONTO, ONT.: Gardeners' and Florists' Association, The Pavilion. E. H. Carter, 280 Gerrard street, East, secretary.

Nov. 11-13—PROVIDENCE, R. I.: Rhode Island Horticultural Society, Music Hall.

Charles W. Smith, 61 Westminster street, secretary.

Nov. 12 and 13—NEW YORK: N. Y. Gardeners' Society, Hotel Astoria, 84th street and Fifth avenue. J. H. Troy, manager, 865 Fifth avenue.

Nov. 16-19—CLEVELAND, OHIO: Florists' Club. G. A. Tilton, 85-87 Woodland avenue, secretary.

Nov. 20—BOSTON, MASS.: Horticultural Society's Prize Exhibition, Horticultural Hall. Robert Manning, secretary.

Not Fixed—SAN FRANCISCO, CAL.: California State Floral Society. Emory E. Smith, manager.

### Chrysanthemum Society of America.

Seedlings.—The committees judging new seedlings will be in session this and every Saturday up to and including November 27.

Exhibitors should make their entries (a fee of \$2 is charged for each variety exhibited) to the secretary, not later than Tuesday of the week in which the blooms are to be shown.

Blooms may be sent to any of the following addresses, express prepaid:

Boston.—A. H. Fewkes, Horticultural Hall.

New York.—Eugene Dalledouze, care of Dr. F. M. Hexamer, Madison Square Garden.

Philadelphia.—Edwin Lonsdale, 1514 Chestnut street.

Cincinnati.—B. Witterstaetter, corner Fourth and Walnut streets.

Chicago.—W. N. Rudd, room 202, 185 Dearborn street.

### Secretary's Official Report.

Reports of Committees of Chrysanthemum Society of America on seedlings exhibited on Saturday, October 16, 1897.

#### AT NEW YORK.

Mrs. Arthur J. Caton, Exhibited by W. N. Rudd, Mt. Greenwood, Ill., Japanese; Light mahogany. Scored 55 points.

Ben Nevla, Exhibited by Wm. Anderson, Mamaroneck, N. Y., Japanese Reflexed; Creamy white, striped pink. Scored 80 points.

#### AT CINCINNATI.

Boundless Snow, Exhibited by E. G. Hill & Co., for H. Yoshike, Oakland, Cal., Japanese white. Scored 87 points.

Mrs. Arthur J. Caton, Exhibited by W. N. Rudd, Mt. Greenwood, Ill., Japanese Bronze. Scored 75 points.

#### AT PHILADELPHIA.

Mrs. Arthur J. Caton. Exhibited by W. N. Rudd, Mount Greenwood, Ill., Japanese Reflexed; Bronze. Scored, commercial 88; exhibition 91.

#### AT BOSTON.

Mrs. Arthur J. Caton. Exhibited by W. N. Rudd, Mount Greenwood, Ill., Japanese; Reddish orange, reflex orange-yellow. Scored 75 points.

There is more Catarrh in this section of the country than all other diseases put together, and until the last few years was supposed to be incurable. For a great many years doctors pronounced it a local disease, and prescribed local remedies, and by constantly failing to cure with local treatment, pronounced it incurable. Science has proven catarrh to be a constitutional disease, and, therefore, requires constitutional treatment. Hall's Catarrh Cure, manufactured by F. J. Cheney & Co., Toledo, Ohio, is the only constitutional cure on the market. It is taken internally in doses from 10 drops to a teaspoonful. It acts directly on the blood and mucous surfaces of the system. They offer one hundred dollars for any case it fails to cure. Send for circulars and testimonials. Address, F. J. CHENEY & CO., Toledo, O. Sold by Druggists, 75c.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

INCUBATORS Self-regulating. Catalogue free. C. S. SINGER, Cardington, O.

## A \$1.00 Raisin Seeder for 50c.

### POSTPAID.

We are tired of selling dealers and waiting 90 days for our money, so we will sell housekeepers at Jobbers' prices.

Send 50 cents, and we will mail you postpaid one of our best

### BAY STATE RAISIN SEEDERS

Guaranteed to seed 1 lb. of raisins in 5 minutes. Simple to operate and easy to clean.

EASTON MFG. CO. D. 10, 64 Federal Street, BOSTON.

Mention American Gardening when you write.

### Palmer's Hot-bed Mats,

For Cold Frames and Hotbeds.

These mats are made of strong burlap lined with wool and quilted.

They are warmer than straw, more easily handled, do not retain moisture, do not freeze, rot, mildew or harbor vermin as straw does, and cost only one-fourth as much. They are made six feet wide, any length. Horse Blankets of same material. The best, warmest, strongest and cheapest blanket made. THE E. T. PALMER CO., 118 Worth St., N. Y. Mention American Gardening when you write.

ESSEX
10c

makes  
House Plants  
thrive and bloom.

Use once in ten  
days the first month  
and once a month  
thereafter. The 10c.  
package will feed twelve  
plants one year. Full directions in  
every package. . . . .

**ASK YOUR DEALER FOR IT.**

Save the plants by using Essex Flower Food—  
then save the wrappers of the 10 cent package.  
For twelve of these wrappers we will mail a beautiful study of Jacqueminot Roses, by the celebrated artist Paul de Longpre. This picture has no advertising. If your dealer does not have the 10 cent package send eight 2c stamps to Russell Cement Co., Gloucester, Mass., and get full size package by return mail.

### POT YOUR PLANTS IN

# JADOO FIBRE

### WATER YOUR PLANTS WITH

# JADOO LIQUID

And they will thrive during the Winter.

Particulars and Prices on Application to

**THE AMERICAN JADOO CO.,**

813 Fairmount Ave.,

PHILADELPHIA, PA.

# Henry Strawberry Plant Premiums

Will be shipped to all who desire them this season until ground freezes.

Owing to the wonderful run on this unequalled Strawberry we are preparing 100,000 Henry plants for Spring delivery, and in this connection we desire our readers to remember

## Two Facts

- 1—The Henry Strawberry can be obtained solely through a subscription to AMERICAN GARDENING; as the publishers will not sell plants under any consideration;
- 2—Neither will Mr. Jerolaman.

## Who is Entitled to Plants

**New and Renewal Subscribers.**—Five plants of the Henry will be mailed, postpaid, as a premium to every Renewal or New Subscriber sending us \$1.00 for a year's subscription. When remitting be sure to state if you want this premium.

**To Agents and Workers.**—For every \$1.00 received from agents and others for New Subscriptions, we mail, postpaid, Ten Henry plants, Five to the New Subscriber and Five to the Agent.

## Special to Club Raisers!

**Clubs of Ten.**—To every agent sending us in a club of Ten New Names and \$10.00, we will forward in payment therefor One Hundred (100) Henry Strawberry Plants, by express, as well as send Five plants, postpaid, to each person in the club.

Mr. Jerolaman's series of articles has been put in pamphlet form; and agents will be supplied with copies on application. Best campaign matter out.

Address Your Letters,

**AMERICAN GARDENING,**  
P. O. Box 1697, NEW YORK.

## ALL ABOUT THE HOME PLOT

### POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

#### Hellebore for Lice.

One of the poultry papers gives—but without editorial commendation—a note concerning the use of hellebore for lice on chickens. Cheapness and efficiency are the points made for it, and it is said to be entirely safe to use. We have not tried it, nor can we see any reason why it should be more effectual than any other dust (say road dust or coal ashes) inasmuch as the lice do not eat it. We pass the idea on, however, for what it is worth.

#### Ten Cents a Pound.

An expert tells an inquirer that ten cents a pound isn't much of a price for poultry, and that if food has to be bought, it is useless to expect to raise chickens for this price at a profit. It is true that ten cents is not much of a price, especially to those who have once looked at broiler prices. But a five-pound chick at this price will bring half a dollar, and with judicious feeding, need not cost much more than half this sum to raise. The grower may have at least 40 per cent. of his receipts to pay for time, losses, interest on investment, and actual profit. His investment need not be heavy; his losses depend upon himself; his time may or may not be valuable. Hence, it is largely a matter of circumstance whether ten cents a pound is or is not a paying price for poultry carcasses. We fancy that many a farmer, and indeed, many a business man, might be very glad of an average per cent. of profit equal to that which poultry, even at ten cents a pound, may give.

#### Bringing Out Chicks.

Those who wish to raise broilers are just about ready to begin their season's work. November finds them ready for the fray, but if they are beginners they may often get ready, yet not go very far. Defeat often comes when just at the point of success. Every incubator worker finds a greater or less number of apparently perfect chicks which are unable to leave the shell. One of the best incubator manufacturers, a man long in the business, says that there are several reasons why these chicks die. They should pip through the air cell and at the large end of the egg. They sometimes fail to pip because of making the effort at the under side of the egg, where it rests on the bottom of the tray; sometimes failure results because the shell is too thick. Some of these difficulties may be avoided by keeping an eye on the eggs, reversing those that are pipping at the wrong point, and removing the large end of the shell for those which are likely to smother because of not having broken through both the shell and its lining. This must not be done until the chick is working hard to get out. Such help must be given rapidly if at all, because the machine must not be kept open long enough to lower the temperature.

#### Cleaning Duck Feathers.

Some one makes inquiry as to the process. Feathers that are unsoiled and dry do not need cleansing, unless so oily as to emit a disagreeable odor. All kinds of feathers may be washed by the use of soap or borax, they being placed in a very light bag before the operation, and loosely enough to dry quickly. Strong heat is necessary that the feathers may dry, instead of decomposing, as they are prone to do.

#### Where Are the Novelties?

Real novelties in bulbs are almost as hard to find as the proverbial needle in a haystack. The present season shows scarcely an attempt to offer anything entirely new. We have *Camassia cusickii*, and the large-flowering *Freesias*, brought over from last year, and one firm has made a selection from these last of a pure white sort to offer as a novelty. The so-called *Palestine Iris*, and one or two *Hyacinths* (*Flevo* and *Minerva*) are offered

as new, and this about completes the list. The yellow *Oxalis*, both single and double, and the scarlet *Freesias* are trying to masquerade as novelties, appearing in enormous size on a colored plate.

#### Hyacinths of Best Form.

The choice of color having been made, there is scarcely a grower who will be well satisfied with a *Hyacinth* unless it have either a fine truss of bloom or very large individual bells. These two characteristics make the fine *Hyacinth*. Among those having good spikes, or trusses, are *Queen of the Blues*, *Gertrude*, *Amy*, *La Grandesse*, *La Pluie d'Or* (*Rain*, or *Shower*, of *Gold*) *Regina Victoria*, and *La Virginité*. Prominent among those with large bells are *Grand Lilas*, *Victoria Alexandrina*, *Herman*, *Goethe*, *White Crown*, *Groot Voorst*, and *Sir Walter Scott*. Novices in the culture of *Hyacinths* should note the fact that a fine truss of bloom can never be secured from a poor bulb, nor should it ever be expected from bulbs not allowed to become well rotted. Other things being equal, singles will give best results in such hands, the doubles often refusing to push up from the throat of the bulb.

#### Buying Pullets.

The fall buyer often finds sale pullets about as scarce as hens' teeth, yet they are to be had if one knows where to look. In the cities, one may go to the wholesale handler of birds, and select pullets from large shipments, at from two to four cents a pound above the regular market rates. The mid-autumn season is really the best time to buy, and the best stock, it is said, comes from the middle west states. Southern stock is available at most seasons, but calls for good judgment in the buyer, and strict quarantining for a considerable period, lest new diseases be introduced into the general flock.

#### Prize Birds and Prize Condition.

The autumn fairs amount to very little for poultry showing. Birds are seldom in condition to be judged with any degree of fairness. But as the real show season for poultry comes on, condition becomes a matter of skill. To wash birds, to brush their feathers, to manipulate their combs and the droop of their tail feathers, to feed bread and sugar to get them up to their standard weight, to give individual birds a whole yard or pen to themselves, seems like much ado about nothing to the novice. Yet these things may make several points difference, while the prize often hangs upon a half-point, sometimes even upon a quarter-point. When competition is as close as this, exhibiting must be a lottery, even under the most honest judge. It is doubtful that the man exists who can score the same breeding pen twice within a quarter of a point. Yet if one pen scores 475 points, and its close competitor 475¼ points, the latter gets the coveted prize, the advertising, the sales. It isn't just, but how to better it is a problem yet unsolved.

#### Blue in the Window.

The choice of colors for the window is a matter which has the largest effect upon its general appearance, especially from the outside. The reds and yellows are the most brilliant and showy; the pinks and whites the most dainty; the blues, the least satisfactory of all. The nearer the blues approach to purple, the more nearly true is the foregoing statement. Very pale blues, and clear sky-blues are very pretty from the inside. None of them, however, adds very greatly to the appearance of the window from the outside, simply because they do not show. There is something in the color itself which does not show off against a background of green, especially if the spectator is at a little distance. Blue needs white or yellow to bring it out, and of course it cannot have much of a background of these in the ordinary window.

#### Hyacinths in Water.

Many people are afraid to try *Hyacinths* in water, just because they never have done so; but it is a very simple matter thus to bloom them. One needs good bulbs, to be sure, but it is not neces-

sary to insist upon the very highest priced exhibition bulbs. When glasses are used, they should be filled with water to such a point that the bases of the bulbs rest in the water. This height of the water should be held as nearly as possible till bloom is past. The dark room for root formation is as necessary as when potting in earth, but the period may be shortened to ten days or two weeks. As the water becomes impure, the bulbs may be taken out and rinsed carefully, the glasses cleaned, and fresh water supplied. The use of glasses is desirable many times both because the bloom may be advanced faster in water, and because the glasses present a better appearance than do pots. It should be remembered that gas light is one of the worst enemies of Hyacinths in water. Of course they have not quite the resistant power of those grown more naturally in earth. The choice of varieties, too, is a matter of moment among the doubles.

#### Little Gem Calla.

The season's experience with Little Gem Calla may throw a sidelight upon the often unsatisfactory behavior of this desirable little plant. Early in the spring two roots were procured from two different firms, and costing respectively, 15 and 25 cents. As the latter was about the maximum price of the season, it should rightly have secured a plant of the best grade. The two roots were potted together in a three-inch pot where they had abundant room, and were later transferred to the open ground, with the hope of urging them to do their best. Last week they were re-potted, the smaller one showing a diameter of a quarter of an inch, the larger one of a good half-inch. Is it reasonable to expect roots of this size to give bloom? They are mere infants, and must have time to mature before beginning their life work.

#### La Reine des Jacinthes.

A magnificent and superb dark red is what a prominent firm calls this beautiful sort, and it kindly informs its readers, in addition, that the name means King of Hyacinths. Inasmuch as La Reine really means "the queen," we submit that this looks like a scheme to defraud lovely woman of her plain rights.

MYRA V. NORRIS.

**Horticultural Books.**—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send sc. stamp for our new catalogue.

**\$150.00 CASH—FREE**

STASESETUSEMC  
TANIRUP  
GEKEARARS  
RERERTO  
NIDDOPL  
HALMDAHEDR  
VOLPIAM

We herewith give a list of jumbled words from which can be made the names of seven of Uncle Sam's new warships. They are easily transposed when you know how to do it. For instance, the word: RERERTO is "Terror." Try it. We will give:

First Prize in Cash—\$50.00 to ten persons first sending correct answers.  
Second Prize in Cash—\$50.00 to next 20 persons sending correct answers.  
Third Prize in Cash—\$50.00 to next 50 persons sending correct answers.  
Fourth Prize—Kombi Camera to each of next 25 persons sending correct answers.  
Should more than the required number send correct answers, the awards will be made according to date letter mailed, hence it is advisable that your letter should be among the first. You can win one of these prizes if you are quick and use your brains. The above awards are given free as an inducement to read New Ideas, a handsome 16-page illustrated journal covering entirely new field. It gives information about the latest inventions and progress in science, illustrating the most striking novelties for business and household use. Subscription price is the only cheap thing about it. Answer to-day!

**TERMS.**—You must send with your answer 25 cents (stamps or silver) for a Six Months' Trial subscription to New Ideas.

#### ALL SURE OF A PRIZE.

Aside from the prizes above named, we will give a special prize to such persons whose letters fail to reach us in time for the Cash Prizes, or who do not correctly answer the list, provided that 25 cents in silver stamps be sent for a six months' subscription to New Ideas. These special prizes are awarded along the lines of Novelties, Music, Decorative Art, Story and Fiction. Be sure to state in which you wish to compete. This contest will close Monday, Nov. 30th, and names of prize winners will be announced in Jan. number of New Ideas. Address, New Ideas, Sta. K, 224, Philadelphia, Pa.

## HENS AND EGGS

fruit culture and poultry keeping dovetail together perfectly, each filling a season comparatively dull in the others.

Realizing the above facts, we have arranged with the publishers of **POULTRY MONTHLY**, to offer that journal in club with **AMERICAN GARDENING**, for the coming subscription season, both journals postpaid, one year, for the **SMALL SUM OF \$1.25.**

**POULTRY MONTHLY** is now in its nineteenth year; it has always been recognized as the leading publication in its particular field. Sound and reliable in its teachings, and not the mouthpiece of cranks, cliques, or rings. Its correspondents are practical and successful men, in the harness to-day. The publishers of **AMERICAN GARDENING** recommend **Poultry Monthly** as being one of the very best poultry papers issued, and advise all interested to accept this Great Combination Offer.

#### A WONDERFUL OFFER!

**American Gardening (Weekly), \$1.00 (Both \$1.25)**  
**Poultry Monthly, - - 1.00** One Year, postpaid.

Present subscribers who are in arrears must pay up in full to become eligible to this offer.  
Address **AMERICAN GARDENING, P. O. Box 1697, New York City.**

### A FRENCH MOTHER'S ADVICE

to her son, when looking over one of Napoleon's old battle-fields, was: "No matter where, when you get to be a man, if you have any money, buy a few acres of land as a haven to which to retreat in case of storm; because, come war, flood, or cyclone,—if life is spared, you can commence again to raise your own potatoes;" to which we add, "be sure to protect it with **Page Fence**."

**PAGE WOVEN WIRE FENCE CO., Adrian, Mich.**

Mention American Gardening when you write.

## Home-Mixed Fertilizers

A man can save hundreds of dollars by mixing his own fertilizers. He saves about half the first cost; he can use the materials best adapted to the particular crop, and consequently secure the best results possible for the money spent. **Nitrate of Soda** should be used to furnish the nitrogen (ammonia). It is not only the *cheapest*, but the most soluble, available, and in every way the best form of nitrogen.

**Free** A 40-page book, "Food for Plants." Tells all about mixing and using fertilizers. Please ask for it.

**S. M. HARRIS, MORETON FARM (P. O.) N. Y.**

# WHOLESALE MARKETS.

## New York.

The cut flower market continues to be over stocked and prices rule low; Chrysanthemums never sold so badly in the history of the trade.

The market for fruits and vegetables is in a better condition since our last report, and stock has cleared much better and an improved feeling exists all round.

Hot-house grapes are selling poorly, 50 cents per pound being the best price obtainable. This is largely due to the inferior condition of the stock and the much superior condition and appearance of the English arrivals which are at this time extraordinarily good. The Gros Colmar seen would never lead one to think they had journeyed 3,000 miles. Why are our own grapes so poor that are now on the market? This is a pertinent question for American growers and shippers.

Hothouse tomatoes are coming in freely and make 25c., per pound. Some fine outdoor grown are seen which sell at \$1 per box.

Hothouse cucumbers are making \$4 to \$6 per 100.

Mushrooms 50c. to 75. per pound.

Apples—Jonathan, good to fancy, only offered, \$3.50@4.50; Albemarle Pippin, Va., \$2@2.50; good to fancy, \$3@4; Wine Sap, Va., poor to fair, \$1.50@2; good to fancy, \$2.50@3.50; Johnson's Winter, Va., poor to fair, \$1.50@2; good to fancy, \$2.50@3.50; Snow, state, poor to fair, \$2@2.50; good to fancy, \$3@4; King, state, poor to fair, \$1.50@2; good to fancy, \$2.50@3; Ben Davis, western, good to fancy, \$2.50@3; Vir-

ginia, poor to fair, \$1.50@1.75; good to fancy, \$2@2.50; Jersey, poor to fair, \$1.50@1.75; good to fancy, \$2@2.50; Greening, state, poor to fair, \$1.50@2; good to fancy, \$2.50@3; Baldwin, state, poor to fair, \$1.25@1.75; good to fancy, \$2@2.50; Phoenix, Jersey, poor to fair, \$1.25@1.75; good to fancy, \$2@2.50; N. Spy, state, poor to fair, \$1.50@2; good to fancy, \$2.25@2.50; mixed lots, poor to fair, \$1@1.75; open heads, poor to fair, \$1@1.50.

Pears—Bartlett, ice house, per barrel, \$1@4; per bushel box, 50c.@1.50; Seckel, per barrel, \$3@5.50; per bushel box, \$1.25@2; per keg, \$1.50@2.50; Beurré Bosc, per barrel, \$2@3.50; Kieffer, Jersey, per barrel, \$1.50@2; up-river, per barrel, \$1.25@1.75; open heads, per barrel, \$1@1.25; Beurré d'Anjou, per barrel, \$1.25@1.75; other late sorts, fair to good, per barrel, \$1@1.50.

Quinces—Apple, good to fancy, per barrel, \$2@3; poor to fair, per barrel, \$1@1.50.

Grapes—Delaware, Keuka, per small basket, 10@12c.; other state, per small basket, 9@10c.; Niagara, western N. Y., per small basket, 7@11c.; Catawba, western N. Y., per small basket, 7@8c.; Concord, up-river, per case, 40@55c.; western N. Y., per large basket, 11@12c.; western N. Y., per small basket, 7@8c.; inferior stock, small baskets, 4@5c.

Nuts—Chestnuts are still scarce; sale of fancy northern at \$6@7 per bushel; southern sold mainly at \$4@4.50; hickory nuts quoted at \$1@1.25 as to size and color; Bull nuts 75c. per bushel.

Cauliflowers—Prime to choice, per barrel, \$1.75@2; poor to fair, per barrel, \$1@1.50.

Celery—Choice to fancy, large, per dozen, 25@30c.; fair to prime, per dozen, 12@20c.; small and poor, per dozen, 8@10c.

Cabbages—Jersey and Long Island, per 100, \$3@4; state, per 100, \$2.50@3.

Cucumbers—Florida, per crate, 50c.@ \$1.

Green peas—Virginia, per one-half barrel basket, 75c.@ \$1; N. C., per bushel basket, 50@75c.

Onions—Orange Co., red, prime, per bag, \$1.50@2; Orange Co., yellow, per bag, \$1.50@1.75; Orange Co., white, per bag, \$1.50@3; Orange Co., inferior, per bag, \$1@1.25; state and western, yellow, per barrel, 75c.@ \$1.75; Shelter Island, yellow, per barrel, \$1.75@2; eastern, white, per barrel, \$1.75@4; eastern, red, per barrel, \$2.25@2.50; eastern, yellow, per barrel, \$2@2.25.

Okra—Florida, per carrier, \$1.50@1.75. String beans—Virginia, green, one-half barrel basket, 50@75c.; Virginia, wax, per one-half barrel basket, 50@75c.; Charleston and N. C., bushel basket, 25@35c.

Squash—Hubbard, per barrel, \$1@1.25; Marrow, per barrel, 75c.

Tomatoes—Per box, 40@75c.

Turnips—Russia, Canada, car lots, per barrel, 75@80c.; Russia, Jersey, per barrel, 50@65c.

very slowly, and are selling worse than anything else on the market. Even at the quoted prices a great many baskets go to waste. Concord, 5-pound basket, 6@7c.; per 10-pound basket, 11@12c. Delaware, per 5-pound basket, 10@11c.; Niagara, per 5-pound basket, 9@11c.

Cranberries—Cape Cod, choice and fancy, per barrel, \$5.50@6; medium as to size and color, per barrel, \$4.25@5; per crate, \$1.50@2; Jersey, per crate, \$1.50@1.75.

Cabbage—Per 100, in large lots, \$1.50@2; small quantities higher.

Cauliflower—Choice, per barrel, \$1.25@1.50; fair to good, per barrel, 75c.@ \$1.

Celery—Choice, large, per dozen, 25@30c.; fair to good, per dozen, 15@20c.

Cucumbers—Florida, per crate, 50@75c.

Egg plant—Jersey, one-half barrel box, 50@75c.

Green peas—Charleston, per basket, \$1.25@1.40; Virginia, per basket, 75c.@ \$1.25.

Lima beans, per bag, 75c.@ \$1.25; flat, per 100 pounds, \$2.40.

Onions—White, per barrel, \$2.75@3.50; red, per barrel, \$2@2.25; yellow, per barrel, \$1.75@2.25; per bushel, 60@70c.

Peppers—Jersey, red, per barrel, \$1@1.50; green, per barrel, 50@75c.

String beans—Southern, per basket, 30@50c.

Squash—Hubbard, per barrel, 75@90c.

Potatoes—Receipts have been smaller and prices have ruled firmer. Most of the stock continues to be of inferior grade, and sells at irregular prices; choice to fancy stock in carload lots has sold at, per bushel, 60@65c.; fair to good, 50@55c.

Jersey sweets—Per basket, 25@30c.

Hothouse tomatoes have been scarce on the market, and most growers now sending in have hotel trade; choice fruit is selling at 30@40c. per pound.

Mushrooms—The same condition applies to these also; prices have been from 40@60c. per pound.

## Boston.

This market has been well filled with all kinds of fruit and produce last week. Many of the stocks have varied in quality, so that all kinds of prices have ruled; for instance, some extra fancy Ben Davis in large barrels free from heat and sold packed, bring \$2.75; while other Ben Davis, barrels having just a little decay, slack packed, bring from \$1.50 to \$2, according as customers can be found.

Good Greenings, Baldwins and Spies, providing the old-time No. 1 stock can be found, bring \$2.25, but an idea seems to exist in packers' minds that apples are scarce, and it seems as if more cider apples were found in No. 1 packing than ever came to light before.

Choice table apples sell from \$2.50@3.50. Some Gravensteins even bring \$4.50.

Hothouse tomatoes holding their own, 15@20c. a pound.

Pears are sufficient supply for any demand, with prices unchanged from those existing last week.

Hothouse grapes have a demand from a certain class of customers largely invalids, at from 40@75c. a pound.

New York state Delawares are getting towards their end and bring 14c. in pony baskets; Niagaras 9c., Concords 6@7c., Marthas 6@7c., Catawbas 7c. Just at present time this city is using a large quantity of Concord grapes packed in 9-pound baskets which sell in large quantities, 10@10½c.; truly not much money for the grower.

Very little demand for lettuce, practically none excepting for some very large choice heads.

Onions keep moving at \$2 a barrel; most of the stock coming from New York and Ohio.

Cucumbers from the hothouses move fairly well, 3@5 a hundred; quite a good many orders coming in which are pleasantly filled.

Virginia, North Carolina, and Georgia are putting their second crop of string beans in this market in larger supply

## DO YOU NEED WATCHING?

Or, to put it another way,  
**Do You Need a Watch?**

We sell them, sell them at such an exceedingly low price that you can't afford to go watchless.

Got 'em all sizes and styles.

But we'll just mention two:  
An Elgin or Waltham Watch, best movement made, hunting case, accurate time-keeper, handsomely engraved, Beiber Case, heavily gold-plated—last for all time. Ladies' or gentleman's size.

We'll send it to your address with privilege of examination. If it's not entirely as represented, send it back—costs you nothing. If you like it, pay the agent express charges and \$6.50. That's fair. Or this—

A Hunting Case Watch—beautifully engraved case, first-class movement, any size, heavily plated (14k)—looks just like a \$40.00 gold watch—keeps as good time as any of them. Sent to your express agent with privilege of examination—same conditions as all our watches sent out—and if you like it, pay him \$5.45 and express charges.

If you take our word for it, and send money with order, a handsome chain goes with either, and express charges are paid by us, for the prices named above.

Royal Manufacturing Co.

324 Dearborn St., CHICAGO.  
Mention American Gardening when you write

## Philadelphia.

This market has been overstocked this past week, both in fruit and vegetables, and the demand has fallen off considerably. All buyers being very cautious, prices have not been so firm, and many sales have been made below these quotations, as is always the case when there is an over-supply.

Receipts of apples have been large, but the supply of choice fruit has been limited, the bulk of the receipts being of inferior grades which has been worked off at lower prices. Jonathan, choice and fancy, per barrel, \$3.25@3.50; Twenty-Ounce, choice and fancy, per barrel, \$2.50@2.75; fair to good, per barrel, \$1.75@2; Ben Davis, choice and fancy, per barrel, \$2.25@2.75; fair to good, per barrel, \$1.25@1.75; mixed varieties, choice, per barrel, \$2@2.50; fair to good, per barrel, \$1.25@1.75.

Quinces—No. 1, per barrel, \$1.75@2; No. 2, per barrel, 75c.@ \$1.25.

Pears—Seckel, per barrel, \$2.50@3.50; per one-half barrel, \$1.50@2; Louise Bonne, per barrel, \$1.50@2; per one-half barrel, 75c.@ \$1.25; Duchess, per barrel, \$1.50@2.25. Grapes have been moving

than required; find slow sale, 75c. @ \$1 per bushel. Virginia and North Carolina also have placed a good many peas here, second growing. The average man does not want them at this season of year, consequently do not move very fast, even at 75c. a bushel.

Cabbage plenty, 3@4c. a head; cauliflower unchanged, 10@18c. each; shell beans are plenty enough to supply the demand, with no change in prices.

Cranberries broke away a little and some very good stock being sold \$4.50, and rarely anything good enough to bring over \$5, crates \$1.50.

Limited demand for carrots, 50@75c. a bushel; beets 35@40c., parsnips 60@70c., the purple top turnips 40c. a bushel; while the St. Andrews or large white turnips bring 75c. a barrel.

Squash are a little more plenty than desired; hard-shelled Hubbard, \$15@20 a ton; near-by farmers bring in their Marrow for which they get \$1 a barrel, while for Turbans and Bay State they get \$1.25.

Mint can be had at 40c. a bushel and parsley at 50c.

Potatoes take a wide range; no more-so, however, than the range in quality; fine Hebrons can be had at 65c. down to 60c.; stock coming here from Michigan and western New York has given very good satisfaction, sells 50@60c., while that from Minnesota would take a range from 40@60c.

Mushrooms easier at \$1 a pound. Lighter supply of sweet potatoes caused an advance, and \$1.75@2 present quotations.

Quinces, good demand, 35c. a peck for No. 1 stock; New York state stock in barrels, \$8.50@4.

Chestnuts, better demand, \$6.50 a bushel. Shellbarks move freely, \$1.50.

Last week this city experienced in 36 hours a drop in the temperature from 89 down to 32, and some people wonder why those living in Boston are so healthy.

## SOME BARGAINS IN CLUBS FOR Men, Women and the Young.

**Ohio Farmer**, a giant among the agricultural weeklies, and American Gardening. The two, one year, For \$1.80.

**Farm, Field and Fireside**, a 32 to 40 page weekly Farm and Family Journal, the best of its class, and American Gardening. The two, one year, For \$1.50.

**Country Gentleman**, This weekly amply covers the field its title indicates. Every country gentleman should subscribe to it. And American Gardening. The two, one year, For \$2.75.

**Farm Journal**, the "little giant" of monthly journalism in matters agricultural, and American Gardening. The two, one year, For \$1.25.

**Farm Poultry** (semi-monthly), and American Gardening. The two, one year, For \$1.50.

**Poultry Monthly** and American Gardening. The two, one year, For \$1.25.

Above is your choice of two most excellent poultry magazines. And nearly every one of our readers keeps poultry. Why not subscribe to both? The two poultry papers and American Gardening, one year, For \$2.25.

**Meehan's Monthly**, a horticultural stand-by, and American Gardening. The two, one year, For \$2.85.

**Harper's Magazine**, as good as ever; none better among the literary monthlies, and American Gardening. The two, one year, For \$4.25.

**Ladies' Home Journal**, an unrivaled monthly for women, the standard in its class, and American Gardening. The two, one year, For \$1.90.

**Youth's Companion**, of Boston. At the head of all journals for both boys and girls, and read by the elders, too. New subscribers only and American Gardening. The two, one year, For \$2.85.

# OUR CLUB LIST

LET US FILL YOUR ORDERS FOR 1898.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

## The Water Garden

BY WILLIAM TRICKER.

PRICE, \$2.00. 25 per cent. off to subscribers to American Gardening and Florists' Exchange.

This work contains nine beautiful plates, eighteen full page descriptive views of leading Water Gardens and Ponds, and numerous smaller pictures prepared with special reference to this work. On heavy enamelled paper.

Elegantly bound. Large octavo.

The text describes all operations from the growing of plants in tubs to the large water garden, excavation of grounds, construction of ponds, adapting natural streams, planting, hybridizing, seed saving, propagation, the aquatic house, wintering, correct designing and planting of banks and margins, and all other necessary details.

### Combating Aphis on Violets.

I am interested to the extent of twenty thousand plants in violet culture and have been growing them with more or less success for five years. The hardest problem found in handling them is to control the aphis. I have used tobacco stems and powder, and while the aphides are kept in check the plants almost invariably suffer severely with spot after the use of tobacco in any form except smoke. My houses are sash-built and are now open or I would fumigate with tobacco, which, as already stated, has been the only safe way I have used it. The plants look more promising now than ever before this season, but are beginning to suffer from the attacks of aphides. What can be done to keep them in check and do the least harm to the foliage? To use the hydrocyanic gas you recommend in the Florists' Exchange is out of the question, as the sashes are all piled up and the houses shaded with lath, mats, and brush.

I have rose-leaf tobacco extract on hand and have been thinking of mixing six ounces of it with two ounces of strong aqua ammonia, saturated with copper carbonate, and let them stand long enough to destroy any fungous spores that might be in the tobacco extract, then add to a six gallon knapsack sprayer of water and use that as a spray once a week. Would that be absolutely safe? I have been using that amount of the copper carbonate solution to the knapsack of water once a week for the spot. It works well. I have also whale-oil soap on hand.

You can understand that with a good crop in prospect, I am exceedingly anxious not to make any mistake. I am afraid of the tobacco extract unless the copper carbonate will make it safer than other forms of tobacco. It would seem that the spot on the leaves of the tobacco was the same as that affecting the violet leaves.—VIOLET GROWER.

—Aphides, especially the black ones, was once the most serious pest with which we had to contend. Since we have adopted the hydrocyanic acid gas treatment, however, as described in a recent number of the paper, we have had no serious trouble. So important do we consider the matter of being able to use this gas that we shall plant in the future throughout the entire season in such a way that the plants may be fumigated at any time.

We abandoned tobacco entirely some time ago, as we found by experience that no matter how used, it would tend to weaken the foliage and make it more subject not only to spot, but to other diseases as well. It is a mistake to suppose that the tobacco leaves, stems, or extract contain the spores, or reproductive bodies of the spot fungus, and that when any of these materials are used we are sowing the seed of disease, so to speak. While tobacco in various forms may contain a few spores, there is never a time when the reproductive bodies of the fungus causing spot are not present in the air. If the foliage is kept strong and vigorous, however, the spores cannot infect it. By actual experiments we can tell how many spores of the fungus will fall in a given time on a space, say one inch square. At night, when the air is still, it is not uncommon for twenty-five or thirty spores to fall in three hours on a space the size of a twenty-five cent piece. Every one of these spores is capable, under certain conditions, of germinating and infecting the leaf and producing a spot. It is no wonder, therefore, that we frequently find plants literally eaten up by the disease.

Now when tobacco is used, either as smoke, dust, stems, or extract, it seems to in a measure check the vital functions of the leaf, the little cells of which temporarily lose their vitality and their ability to resist outside influences. Here is the opportunity the fungus needs, and it at once takes advantage of it by sending a thin, thread-like growth into the cells. Once the tissue is entered the fungus continues to grow until the plant is able to check it of its own accord. The spot then turns white, but when conditions are again favorable, the fungus will start anew and the spot will be found soft, greenish, and watery. So the battle goes on. If the grower be wise he will try to

handle his plants so that they can of their own accord check the fungus, for this, in the judgment of the writer, is the only way to master the disease when it once starts.

I would never use copper in any form on the foliage, nor would I use lime, for careful experiments have shown that these materials are of little or no use and sometimes may prove positively dangerous. We can produce most beautiful cases of spot with air-slacked lime alone, and can do the same with Bordeaux mixture under certain conditions.

Coming back, however, to the aphid question, the writer would recommend that the sash be put on at once if possible, and then that the plants be given one or two fumigations with cyanide gas, as already described in these columns. If it is not practicable at this time to put on the sash, then instead of using tobacco, give the plants a thorough treatment with a solution of soap. Possibly it may be necessary to make three applications of this material, say at intervals of four or five days.

Take a 5-cent bar of Ivory soap, and with a knife, or preferably a small plane, shave it up, and then add about two gallons of boiling water. The soap will immediately dissolve, when three gallons more of cold water should be added. With a good, strong force pump, provided with suitable hose and a cyclone nozzle, spray the plants thoroughly with the solution of soap. The nozzle should be held down under the plant, and the spray, which is like mist, should be directed at first upwards and then into the crown. It is necessary to be quick, for a motion of the hand, if properly made, under the plant and then down in the crown will wet every leaf and insect. To give opportunity for rapid movements, about 25 feet of discharge hose should be used. Our hose is only three-eighths of an inch in diameter, and, while strong, is very light, so that it can be pulled directly over the plants without hurting them at all. Six gallons of the solution, put on as described, will cover about 500 full-grown plants; in other words, the soap for the work will cost about ten cents per 1,000 plants for each spraying. A great many experiments have been made and many different kinds of soap have been used, but we have found nothing so good as plain Ivory soap. Strong soaps, such as whale-oil, soft soaps, etc., should never be used, as they will injure the leaves in time and will certainly spot the flowers if the plants are in bloom. By actual experiments we have found that the Ivory soap will kill from 80 to 95 per cent. of the aphides with which it comes in contact, and from 90 to 98 per cent. of the red spiders. It will not kill all the spiders' eggs, nor will it in every case destroy the young ones. The red fellows, however, are killed by the soap almost as soon as they are touched, as any one can see by taking a leaf infested with spiders and dipping it into soap solution. When the soap comes in contact with the aphides they make a few struggles and die in from five minutes to half an hour.

The soap should be put on early in the morning and after it has been on the plants for two or three hours should be syringed off with clear water. This syringing serves two purposes, (1) it cleans off the soap, and (2) it washes the spiders and aphides down to the ground, where those not killed starve before they can again reach the plants.

Never mix tobacco with the soap, as it adds nothing to the value of the latter and makes a mess that may show on the foliage for a month. Clean, pure, mild soap will do the work; in fact, after using it for several years, we know of nothing better or cheaper for combating many kinds of insects infesting both greenhouse and house plants.

B. T. GALLOWAY.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

### The Fruit Garden.

**Strawberries.**—As at this time of the year we are liable to get very sudden changes of temperature, it will be well to pay some attention to the strawberry beds. For the past two months, since setting the new beds, we have kept the surface loose and free from weeds, so that the young plants are ten to fifteen inches across, according to the variety, which is a good showing when we consider how little rain has fallen here since the plants were set. Now with the refreshing showers of the last week, they will make an extra spurt and keep on growing for a month yet.

In anticipation of more rain, or any kind of weather, we are giving all the lines a coating of rotten manure; that is, all the ground for about ten inches on each side of the lines is covered. Close up to the crowns of the plants a thickness of about half an inch only can be put on, but on the margin it will be two inches thick, and will give the plants the appearance of being in little furrows. It is important that the crown of soft-growing leaves in the center is not covered; in fact, no part of the plant is to be covered with manure, only the ground. Cool nights, heavy dews, and the hoped-for rains will take care of the plants for the balance of this month, unless it be an occasional slight scratching to stop weeds between the lines (2½ feet apart) where the ground is not covered with manure.

**Soil Moisture.**—There is a great deal written, read, said, and forgotten about retaining moisture in the ground or preventing evaporation therefrom, but I have never had the subject so forced upon my notice as during the past ten days, when planting. Having to use some old sod land, I found that it was nigh impossible to get a spade into it, and had to resort to the use of picks. For two feet down there was perfect dust when broken up, and every plant set had to be soaked with water. Another part where some early flowered annuals had been, and the ground since kept free from weeds, was found to be in perfect condition for planting, while on the same border, fifteen feet distant, where the ground was covered with Zinnias (and could not be cultivated), there was not the least appearance of moisture and watering had to be done.

**Scale.**—If you are troubled with scale of any kind, now is a good season to sail into it, and cover the whole wood with kerosene emulsion, diluting it to suit the subject treated. I may add that the emulsion has to be extra strong to do any damage to apple, pear, or plum trees, if applied after the foliage has dropped and before next March, providing that the oil does not gather and run down the trunk in quantity enough to reach the top roots. To guard against that, raise a small cone of soil about the base.

It is a healthy sign to see that our nurseryman is protecting his business and customers by using on the cases sent out the state entomologist's notice that no San José scale, yellows, or rosetts exists among the stock.

J. HOLLOWAY, L. I.

### Quince Tree.

Is there any remedy for the turning of the quince leaves?—E. W. J.

—Probably the soil lacks alkali. By applying a dressing of soft soap before leafing out in the spring, the trouble may be obviated. Rub the soap well in by hand to all parts of the tree limbs, etc.

Apples are very scarce this season at all the Pawtuxet Valley fruit farms, and but little cider will be manufactured this year. The Peach crop of Bristol County, R. I., has been the largest for many years and nearly all of it has been marketed locally for good prices. Pears were fairly abundant.

**Horticultural Books.**—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send a stamp for our new catalogue.

## Bulbs for the Dwelling House.

Among the many bulbs which are now offered every fall, those which can be successfully raised in the dwelling house entirely without the aid of a conservatory, form quite a short list.

### Dutch Hyacinths.

Dutch Hyacinths of all kinds prove elegant house subjects. The principal point to bear in mind in their management is to keep the bulbs, if in pots, in a cool dark place until they have formed roots, previous to bringing them indoors. They should not be brought in early either—after the first of January is soon enough. A place in the corner of the yard where the pots can be covered to the depth of several inches with soil or ashes will be found to work all right, or better still, if they can get the shelter of a frame and sash.

### Roman Hyacinths.

The white Roman Hyacinth, it is not commonly known, can be grown very successfully in pure sphagnum or swamp moss. The bulbs should be planted in it as soon as possible in the fall and not later than the end of October, that is, if they are wanted in bloom along about Christmas, which is a very easy matter to accomplish. For window decoration they look all right in those narrow glass dishes about two inches deep, which the stores sell for a few cents each; any shallow vessel without holes in the bottom will answer the purpose well; put the moss in moderately firm for about three-quarters of the depth of the vessel, then put the bulbs on top of this, one inch or less apart, filling up the spaces left with little wads of moss. Keep cool, just out of reach of frost and in a week or two the bottom of the dish will be covered with nice healthy roots. If several dishes are filled in this manner a succession of bloom may be had in the house all winter long, with very little expenditure, by taking in one at a time, and when this is coming into bloom, introduce another; they will stand the temperature of the warmest rooms and should, of course, get all the light possible, but not necessarily a sunny window, taking care that they never want for water.

### Crocus.

The different varieties of Crocus can be treated in the same manner only they won't stand as much heat as the Hyacinths, but it is a very easy matter to have them in bloom by midwinter, when grown in moss. The Chinese Sacred Lily does well by the same method.

### Narciss.

Most of the Narciss are rather difficult to cultivate successfully indoors, but no trouble will be found with the Paper White, or, in fact, any of the varieties in that section. If grown in moss, see that it is firmly packed about the bulbs.

### Jonquil.

The Campanelle Jonquil succeeds well if the moss be mixed with soil, half of each.

### Freesia.

Freesias are good for the house, provided they be planted early in fairly rich soil and allowed to make foliage before being brought indoors.

### Iris.

*Iris reticulata* and its forms in different shades of purple and violet produce fair-sized flowers every bit as sweetly scented as those of the violet. They naturally bloom in late winter while the snow is melting on the ground. Put six bulbs in a five-inch pot of soil and plunge in a sunny part of the yard; if taken indoors during any part of January they will bloom in a surprisingly short time.

### Oxalis.

The Bermuda Buttercup, *Oxalis corniculata*, is not a bit overrated in the catalogues. There are several species of *Oxalis* which are just as good; among them are *O. Bowleyi*, *O. versicolor*, and the white and pink forms of *O. multiflora*. The Bermuda Buttercup needs moderately rich soil; if the bulbs grow at all, as they ought to, two of them will be enough for a five-inch pot; they will take all the sun they can get.

### Lilium.

*Lilium Harrisii* can be flowered very successfully in a dwelling house; perfect drainage with good soil packed tight around the bulb are necessary conditions. They should be given pots according to size, but not too large; any position, except in a window facing north, suits them.

### Calla.

The Calla Lily, *Richardia æthiopica*, can always be depended upon as a window plant. The dormant bulbs should be started in pots out-of-doors by the beginning of September, to insure the best results.

G. W. OLIVER.

## Protecting Celery.

This is my first year in growing celery, and I have a fine bed of Giant Pascal set 6x12 inches (new way), and growing in low moist land, where the sun shines on a small portion of the plot in winter and the ground stays frozen there longer

## The Chrysanthemum.

[Paper read by Mr. C. Totty, before the Morris Co., N. J., Gardeners' and Florists' Club, at Madison, N. J.]

When we speak of the Chrysanthemum we usually mean the large Chinese and Japanese varieties, though in its different forms and species the Chrysanthemum is found nearly all over the world. All through Asia on the barren steppes of Siberia is found *C. absinthifolium*; in Africa along the Mediterranean Sea is found *C. pumilum*, all through Europe another, and, in fact, every country contributes its species, and right here in America we have the ox-eye Daisy growing so plentifully as to become a nuisance in many places.

In Japan and China the Chrysanthemum has been cultivated for centuries, and there to-day the flowering season is made the occasion of great festivities in

FIG. 212.—CACTUS DAHLIA W. AGNEW. (See page 762).

than anywhere else near here. Celery averages about 28 to 30 inches high now. No blilling up yet, water will not stand on plot long after big rain. I want to keep most of the celery as long as I can and the question is, had I better keep in the bed and bleach, or take up and set in trenches, say one plant deep (crossways), on same land or remove to drier land. We are about 2,000 feet above sea level, and have zero weather sometimes and occasionally 4 degrees to 10 degrees below, though seldom.—AMATEUR.

—The best plan to adopt for the protection of the celery in question is to board it up in the modern way. If the plants are not standing in line properly, leave those that are and transplant others. Ventilation needs to be provided every eight feet, a good hard wisp straw will suffice. This can be taken out on fine days when ventilation is needed and afterwards be replaced easily. Cover the boards well with pine leaves and frost will never be able to get at plants.

which every one from highest to lowest participates. In Japan the order of the Chrysanthemum is made one of the most distinguished decorations of the kingdom, and a representation of the flower is also used as an official seal.

From time to time we hear that Japan holds and jealously guards the long-sought-for blue Chrysanthemum, but no one has yet seen it, though it is frequently represented on Japanese porcelain and in pictures.

It is about 200 years since the first varieties were imported to Europe under various names, but it was not until about 1835 that the first seedlings were shown in England and about the same time in France. From then until the present day the interest in the Chrysanthemum has never waned, but has gone on steadily increasing as new and beautiful forms came into existence.

In England Mr. Salter and in France M. Deleaux were the most successful raisers of seedlings. In America the names of Messrs. Harris, Thorpe, Spauld-

ing, and May stand out prominently in the annals of Chrysanthemum history, and the late firm of Pitcher & Manda has probably sent out more meritorious kinds than any other firm in the world.

The Chrysanthemum is propagated from cuttings which may be rooted from January to June with good results. If big specimen plants are grown January is the time to strike, but for cut blooms several months later is better; for the general run of pot work March is soon enough; and single stems, as they are called, struck in June are in plenty of time to produce fine flowers if the stock plants have been grown cool and hardy. Select always good healthy cuttings, and it will make a good deal of difference in the vigor of the future plant.

When the cuttings are rooted, don't let them stay in the sand to get drawn up; pot them off into 2½-inch pots, grow them along cool and airy, and pot on as they require it, stopping the plants as soon as they get established. For a 9-inch pot three shoots are enough to keep and carry up, and they should give good flowers in the fall.

Bench culture is the method usually adopted for growing plants to one stem and one flower. Plants for this work may be rooted from the middle of May to the end of June with good results; as soon as they are in fit condition they should be planted out in the benches a foot apart. Then the chief thing is to give the plants all the air possible, keeping the atmosphere in a moist growing condition. Black fly is probably the worst pest, and that should be kept in check by tobacco dust or stems, which is also a good fertilizer. The army worm and divers other bugs are troublesome in their season, and will be cursed and discussed many a time before they are all cleaned out, for hand-picking in most cases is the only remedy.

If the finest flowers are needed the crown bud every time is the proper bud to take, but it must be remembered that to develop a crown bud will need some little artificial heat and a bud that forms before the last week in August almost invariably blasts and never develops. If then the crown bud does not show till the end of August, it is safe to take it, but if the grower have any doubt he should rub it out and take the terminal bud. Here he can make no mistake, and will have the foliage right up to the flower though the flower itself will be smaller. The difference between a crown and terminal bud is easily known. The crown bud has three shoots appear just below it, and if they are not rubbed out soon, take all the strength away from the bud, while the terminal, as its name implies, is the terminus or apex of growth and only has a lot of smaller buds around it.

Once the bud is set the plants must be fed with manure water to help it along, which should be kept up till the buds are opening, when it must cease, and a drier atmosphere be maintained, or the petals will damp.

The rest is easy. Give the plants lots of air in the day, keep a buoyant atmosphere at night, and the flowers will be sure to open well. In proportion to the care given the plants, so will the results be. There are no secrets in growing Chrysanthemums. Nothing but lots of work and watching, and no other plant will give such a return for services rendered. Keep all useless side shoots and suckers cleared away to throw all the strength into the flowers. Keep free from all the myriads of insects, and success is reasonably sure.

Every fall we hear the same old story that the Chrysanthemum is no longer popular and nobody wants it; yet to-day there are more grown than ever before, and while it is in season it still, to use the expression of the Kansas girl, knocks the socks off of the prices of Roses and everything else. A glut, say you? Well, perhaps so; but it brings the Chrysanthemum within the reach of poor and rich, and long may the peerless queen of the autumn reign, say I.

Every good gardener wants the best books. Our new catalogue of selected books is the best guide out. Sent for 2c. stamp.

## Diseases of Shade and Ornamental Trees.\*

By B. T. GALLOWAY AND ALBERT F. WOODS.  
(Continued from page 664.)

**Treatment.**—It is seldom that a plant once attacked can be saved, as the trouble is not apparent until the root system is nearly destroyed. If there is any reason to fear this disease, trees should not be set on recently cleared land until the roots of the original vegetation have rotted and the soil is cleared of sticks, limbs, etc. If the trouble appear, the diseased trees should be removed with as much of the root system as possible, and the roots burned; or it is still better to cut the tree down, leaving a stump one or two feet high, and then remove the earth about the roots and allow them to dry out. When dry enough the stump should be burned in its original position. Most of the fungus will in this way be burned and that in the neighboring soil killed. Every precaution should be taken to keep the soil well drained, well aerated, and free from weeds.

**Honey mushroom** (*Agaricus melleus*). Another form of root rot is produced by the mycelium of the honey Agaric, or mushroom. The general appearance of the diseased plant is much the same as when attacked by the southern root rot. Young trees may be killed within a year, but older ones show a weakened, stunted growth, and finally, after several years, dry up suddenly and die when a hot, dry spell comes on. Upon examination the bark at the base of the trunk and on the larger roots will be found to be dead. If a portion of it is removed, a white, leathery growth will be seen between the bark and the wood and between the different layers of bark. It may often be taken out in large sheets of varying thickness. The same will be found between the cortex and wood of the roots. On the outside of the roots and in the surrounding earth dark brown strands, varying in thickness from one twenty-fifth to one-twelfth of an inch, will be found. These may in many cases be traced to the white mycelium between the bark and wood. It is simply the mycelium growing in a different form, as it is not subjected to pressure between the bark and wood. These Rhizomorphs, as they are called, spread a few inches under the surface of the ground from tree to tree, and thus large areas may become diseased from a single center. In the autumn, from the base of the diseased tree and from exposed roots and Rhizomorphs, the fruiting bodies of this fungus develop. They are yellowish brown, and are from three to eight inches high and two to four inches across the top.

**Treatment.**—When once a tree is attacked by the fungus, there is no hope of saving it. If the tree is one of a group, it should be isolated by digging a ditch around it. The ditch should be dug deep and wide enough to get beyond the point where the brown strands of the fungus have reached. This precaution will be necessary only with the Pines and allied trees, as others are not usually attacked unless first injured.

**Polyporus versicolor.**—There is good evidence that this fungus, which is a very common one, may produce root rot in many trees. It is probable, however, that such trees have been previously weakened, thus giving the fungus an opportunity to get in. When it occurs on the side of a stump or root, it forms a thin, rigid, shell-shaped growth, extending out at right angles to the surface. Usually many grow together, more or less united to each other at the back. The individual shells vary in size from one-half inch to two inches or more in diameter. The concave surface is always down and is made up of a layer of very small pores, in which the spores are produced. This porous surface is usually of a whitish-yellow color. The upper surface is shining, smooth, and velvety, marked with various dull-colored zones. The mycelium forms a white, felt-like covering on the roots, penetrating and causing the decay of the bark and wood. The first indication of the disease is in the decreased production or stunted

growth of the wood and a tendency to overproduction of fruit. Examination of the roots of such trees reveals the white felted fungous strands, which continue to increase in abundance until the roots are nearly all rotted off. It is usually several years from the time a tree is first attacked until its death.

The mycelium spreads from tree to tree among decaying roots, so that in the course of years the trees over large areas are destroyed. Healthy, vigorous trees, in good soil, are much less liable to succumb than those growing under less favorable conditions. Trees planted in soil which has been recently cleared are most liable to attack, first, because the fungus is abundant in the decaying roots and, second, for the reason that after a few years the nitrogen becomes greatly decreased, as explained elsewhere. The trees which have up to this time been highly fed and growing vigorously are checked by the decrease of soil food. If this is not at once remedied by fertilization and cultivation of the soil, the fungus may gain a foothold and the tree is doomed.

**Treatment.**—In all cases the rapid changes in soil conditions which follow clearing should be guarded against by not planting until these changes have taken place and until the roots of the original vegetation have rotted and proper soil conditions have been established. If injuries occur on the larger roots or the base of the trunk, the places should be cleaned and coated with pitch or coal tar. Burning the stumps and roots of diseased trees where they stand is advisable if the conditions are favorable for the spread of the fungus. In the early stages of the disease the tree may often be saved and enabled to outgrow the trouble by removing the earth from the base of the trunk and larger roots, clearing them as thoroughly as possible of diseased tissue, and applying coal tar to the wounds.

### DISEASES OF THE TRUNK AND BRANCHES.

**Red rot of Oak** (*Polyporus sulphureus*).—This disease is most common in Oak, but it is also found in the Chestnut, Poplar, Cherry, and Willow. Hartig describes it as parasitic also in Locust, Alder, Walnut, and Pear. As a parasite it gains entrance to the body of the tree through some wound. The mycelium then spreads through the wood, causing it to dry, shrink, crack, and turn reddish brown. In the cracks the mycelium forms large sheets or felted masses, as in the case of the red rot of the Fir and Pine. The inside of a trunk may become completely rotten in a few years from this cause. Whenever any wound permits the mycelium of the fungus to come to the surface, a large group of fruits are produced, extending out from the tree-like brackets. The under surface is made up of a layer of thin-walled pores, whitish at first, then sulphur-yellow. The top is a whitish yellow. The brackets are irregular in shape and size and are usually all grown together in an inseparable mass, which is usually from six to twenty inches or more across and from two to four inches thick.

**Treatment.**—As the fungus cannot gain entrance except through a wound, it may be readily guarded against by properly caring for wounds, as suggested in other parts of this article.

**White Rot of Oak.**—This disease is produced by *Polyporus igniarius*, a common fungus, which sometimes attacks the Oak, Hickory, Willow, and other trees. The mycelium of the fungus grows through the wood, reducing it to a yellowish-white, spongy condition. The *Polyporus* itself develops on the surface of the bark or wood. It is at first spherical in shape, but later assumes the form of a hood with the flat side turned down.

**Treatment.**—The fungus seldom, if ever, attacks sound tissues, hence the proper care of wounds is all that is required to preserve trees from its attacks.

There are numerous other fungi closely related to those described which may produce various kinds of rots in growing trees. Nearly all these gain entrance through cuts and wounds, hence the necessity of properly caring for these, especially during summer, when parasitic enemies of all kinds are active.

(To be concluded.)

\*In Yearbook of the U. S. Department of Agriculture 1896.

## Clematis Dying Off.

To the Editor of American Gardening.

Concerning the numerous inquiries on this subject, I beg to give herewith my opinions as to the cause of Clematis dying off. There is a little white worm that afterwards turns gray as soon as the vine turns black; the worm is very small and cannot be seen without a microscope. The easiest time to find it is as soon as you notice any withering on the top of the vine, which shows it very quickly. The trouble has been known for several years in the old countries, for we examined Clematis for the same trouble in the months of June, July, and August of 1887, '89, and '90, and always found the same little worm down below on the affected vines, but we were never able to find any after the vine had been dead for a few days. We also experienced that we had more trouble on rich and freshly manured land than anywhere else, and for that reason planting on old, well-cultivated soil, we had pretty good success. Some growers have tried tobacco stems lightly covered by soil among the plants, and others have used pyrethrum powder, but I am not sure of their success.

Last spring I planted three Clematis Jackmanni, and three of other varieties. Before I planted them, I put them under a wooden pail, and had the roots covered up with ground about one inch thick; then I put some carbon bisulphide in a cup under the pail. I gave them this treatment two nights, and had the pail taken off during daytime, while I kept the plants covered with straw during that time. One of them did not start to grow at all, but the other five made a fine growth with no trouble whatever. I hope others will try it too and publish their experience in AMERICAN GARDENING.

I always watch the Clematis very closely, especially in the first part of the summer, and cut off and burn up every affected vine as soon as noticed. I also plant the crown of the roots three or four inches deep, which gives a chance that the plant sprouts out again if it should die off at the top.

SUBSCRIBER.

## Catalogues Received.

JOHN FRASER, Huntsville, Ala.—Nursery Stock.

J. H. H. BOYD, Cagle, Tenn.—Price List of Tree Seeds.

Mrs. MAUD M. BRIGGS, El Paso, Tex.—Illustrated Catalogue of Cacti.

PINE TREE FARM, Jamesburg, N. J.—Illustrated list of Poultry, Eggs, etc.

PARSONS & SONS' CO. LTD., Flushing, N. Y.—Select list of Hardy Trees and Shrubs.

D. HAY & SON, Auckland, New Zealand.—Special List of Choice Flowering Plants.

THE LOVETT CO., Little Silver, N. J.—Strawberry, Celery, Cabbage Plants, etc.

ROBERTS MACHINE CO., Collegeville, Pa.—Catalogue of Steam and Hot Water Boilers.

J. M. THORBURN & CO., 15 John St., New York.—List of Sugar Beet Seeds with cultural notes.

CONTINENTAL PLANT CO., Kittrell, N. C.—Standard list of Strawberries with cultural notes.

CLUCAS & BODDINGTON CO., New York.—Offer of Dutch, French, Bermuda and Japan Bulbs.

J. H. BOYD, Cagle, Tenn.—Seeds of Deciduous Trees and Shrubs, also of Evergreens, Forest Seedlings.

JOHN C. MONTGOMERY CO., Chicago, Ill.—Catalogue giving the most improved styles and sizes of greenhouse construction timber, with lots of useful data on that subject.

RELIABLE INCUBATOR AND BROODER CO., Quincy, Ill.—A useful list (224 pages) of every thing wanted by the up-to-date poultry raiser, with many valuable hints as to management.

AUGUST ROLKER & SONS, 53 Dey St., New York.—General Illustrated Catalogue of Florists' Supplies, Decorative Goods, Baskets, Fern Dishes, etc. A very complete catalogue well printed and profusely illustrated.

HERRINGMAN MANUFACTURING CO., Geneva, N. Y.—A Treatise on Greenhouse Heating in connection with the Furman Boiler, is fully illustrated and contains much useful information on heating matters, the steam and hot water tables being especially valuable.

## The Vegetable Garden.

**Ready for Winter.**—Active gardening out-of-doors is now practically over for the season. Everything should be ready for winter. As soon as frost comes, the winter spinach should be mulched with some light covering. A liberal dressing of manure should be given the asparagus bed. Along the coast it is the general custom to give the beds a good dressing of sea weed, and where this is done, it is a good plan to put over it a light dressing of strawy manure, or it will shrivel up too much.

**Rhubarb.**—It is now a good time, wherever needed, to make new plantations by dividing the old roots to two or three good crowns and replanting. And to insure good quick-growing fleshy

FIG. 213.—PORTABLE FENCE.

stalks, it is necessary to give it a liberal dressing of manure, and the soil plowed or dug 15 to 18 inches in depth.

**Seakale** is not grown as much as it deserves to be grown, as it is a very useful vegetable, and is easily forced for winter use. The roots of this can be dug up now, keeping the best crowns for forcing; for this purpose roots should be about six inches long and straight, about one inch in diameter. Such roots planted in mushroom house or under the greenhouse benches, will soon be fit for use. The best of the remaining roots may be reset for future use.

**Cold Frames** containing lettuce, parsley, etc., for winter use, should be provided with suitable materials for covering, as hard frost is liable to occur at any moment now.

**Mats.**—There are now made in New York hotbed mats of burlap, lined with wool waste and quilted, that should prove cheaper, more convenient to handle, and warmer than the straw mats so long used. They are now being

FIG. 214.—FOR SCRAPING OLD TREES.

advertised in this paper. Give ventilation every fine day. Watering, when done, should be early in the day.

**Odd Notes.**—Examine frequently all roots stored away in cellars or pits outside, removing any that may be rotting. Squashes must be kept in a dry warm place. Up to the present writing frost has not done very serious damage to the tomatoes. If there are still any green ones on the vines, they should be carried indoors, and they will ripen on the vines.

W. M. EDWARDS, Conn.

Last year, \$5,750,000 worth of American fruit was exported, over a third going to England. Of these, considerably more than a fourth (\$1,958,000) were apples.

Missouri State Horticultural Society.—The fortieth annual meeting of the Society will be held in Moberly, Mo., December 7th, 8th, and 9th, 1897, in the Court House.

## A Portable Garden Fence.

The cut shows one of the most sensible portable fences that can be devised. Every other panel is rigid, both as regards sidewise and end-to-end motion. This makes the whole fence very firm—a point that is not true of many of the styles of portable fences. It has the advantage also of being put together and taken apart in a moment's time. The construction is plainly shown in the drawing.

## For Scraping Old Apple Trees.

Many neglected old orchards ought to have the dead, loose bark scraped from the trunks of the trees. Here eggs are laid by insects, from which great damage results. Besides, the tree will be much more thrifty if the trunk and branches are kept clear of moss and dead bark. A worn-out hoe, cut into the shape shown in the figure, and sharpened, will prove a very serviceable tool in scraping these old tree trunks.

## Cauliflower in Sandy Soil.

Will you please ask your correspondents to give their experience in making cauliflower head in sandy soil?—T. H. M.

—Cauliflowers will head when grown in sandy soil providing the climate suits them, this last being more important than the soil. The best heads we have ever seen were grown in sandy soil, but near the sea. We do not know what your climate is like.

## Formalin as a Preservative.

In a recent issue, Mr. Jerolamans speaks of preserving strawberries in formalin. Now, I, and perhaps some others of your readers, would like to know something about the process. Does it render the berries unfit for use? Is it used to preserve fruit for show alone?—D. H. BINGHAM.

—Formalin is an aqueous solution of formaldehyde and is used more diluted, simply to preserve form for show; the berries thus kept are absolutely useless for any other purpose.

## To Tie Up Raspberry Canes.

What is the best and cheapest way by the acre to tie up raspberry vines? When is the time to prune them and how many stalks to leave to a bush? Also the best time to set out a new bed?—A. W. C., Conn.

—Fasten No. 9 fence wire to anchor posts one at each end of the row. In line with the posts drive stakes so that the top of them will be three-fifths as high as the bushes after they are trimmed. The stakes to be set 40 feet apart.

Fasten the wire to top of the stakes with staples, taking care to not drive the staples too tight that the wire may slip easily when being tightened with the fence wire stretcher.

Tie the canes with any suitable material for the purpose; raffia I prefer to use when convenient, but wool twine does very well. Wire costs a little at first, but as it can be used many years in the same place it is the best and cheapest in the end. We try to have the old wood (fruiting canes) cut out as soon as convenient after berries are picked and the laterals and ends of the new growth trimmed back in spring after freezing weather is over and before the leaf buds begin to start, leaving no more than five canes to each hill; three to four canes give much better satisfaction. Set out a new block of blackcaps in the spring, but I set out red varieties from July to October. In the summer and fall, but if in the spring I find that the earlier the red varieties are out the better.—C. C. N.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 14, 1894.

PUBLISHED BY  
A. T. DELAMARE Ptg. & Pub. Co. Ltd.  
ROSE AND DUANE STS.  
RHINELANDER BUILDING, NEW YORK.

REGISTERED CABLE ADDRESS  
Commercial Cable) Florez, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MACILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient, and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 3 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

## The Henry Strawberry.

Arrangements have been made whereby a bountiful supply of these plants will be ready for spring delivery to subscribers and agents, and in this connection we beg to call the attention of our readers to our generous offer of these plants in another column. We do not think that a more liberal offer has ever been made than the one now advertised, whereby the agent or worker sending us in a club of ten new names, at \$1 each, becomes entitled to 100 Henry Strawberry plants, while five plants will be sent postpaid to each person in his club. This offer will not apply to a club of less than ten. It may be a very long time before such an offer of such a plant can be made again. The wonderful success which has accompanied our premium offer this fall, in the short time at our disposal to advertise it, leads us to believe that the orders for the Henry Strawberry next spring may exceed all anticipations; however, we have planned for a large supply for delivery and trust to be able to meet all demands upon us. Mr. Jerolaman's series of articles is now being placed in pamphlet form, and copies will be mailed free to all who desire to use same in the canvas for new subscriptions.

All the premium Henry Strawberry plants due to date, have been shipped, except where a request has been made to hold them till spring, and judging by the unsolicited acknowledgments received, they are giving immense satisfaction. In order to reduce weight and hinder excessive transpiration some of the leaves are cut off before shipping, this is especially beneficial during a hot spell, and readers can rest assured all is done for the best.

**Dahlias.** THE favorable season, together with the exhibitions of the Dahlia Society in Philadelphia and the American Institute in New York last season and again this past month, have succeeded beyond question in booming the Dahlia to a marked degree and helped to bring this grand old garden flower into public notice and to all appearances popular favor once again.

That the grand old flower deserves this rejuvenescence there can be no question. For what other garden plant has such a range of color or such distinctions in habit and form? As in the Chrysanthemum, all tastes are provided for. With one it may be singles and favor, and how easily these can be produced too; a packet of seed sown in early spring yields a wealth of color and bloom the same season, which is remarkable.

On the other hand named kinds can be indulged in and by the usual method of propagation such splendid varieties as Paragon, Anna Baroldi, etc., can be perpetuated and all as well by the amateur as the professional. Other tastes are provided for in hundreds of distinct show or fancy varieties; others again may desire the solid, formal pompon, while still more æsthetic tastes can readily be pleased by the various forms of Cactus.

In this last-named class there are now so many fine forms that all tastes and nearly all purposes can be served. Not every one wants the stiff, formal show Dahlia in the house as a cut flower; but no one can object to many of the so-called Cactus varieties with their looser and more irregular outlines. Better still, they bloom, as a rule, earlier in the season and are more prolific. And in this respect too much praise cannot be bestowed upon the charming distinct American variety, which forms the subject of our illustration on page 757.

With us William Agnew began flowering early in July and since that date till the present time has kept up a continuous supply. The plant is a splendid grower and attains a height of about six feet early in the season. The blooms are of great size and the brilliant crimson color makes them very desirable for room decoration. In fact, it makes in our opinion one of the best home Dahlias in existence. As an exhibition sort it is of but little service, for the blooms ship badly. A worthy consort is seen in C. W. Bruton, similar in form, but sulphur-yellow. Both these are the introductions of Messrs. Peacock, of Atco, N. J., to whom is due no small share of credit in fostering the present revival.

The subject of the other illustration, fig. 211, Nymphaea, is another Cactus of great value as a decorative flower, and altogether more dainty than the foregoing. The disposition of the foliage and buds renders it most valuable as a cut flower, while the color, a soft, pleasing pink, makes it still more desirable in that direction; it also has an additional advantage, owing to its good keeping and shipping qualities. The flower is not large, and as an exhibition variety does not count for much. But for home purposes it is all right.

The plant is a good grower and has a long period of blooming; with us up to the same date as the first-named.

**Intensive** WHEN discussing intensive vegetable farming Cultivation. in our issue of Aug. 14, reference was made to the very successful system of a Long Island farmer, Mr. Hallock, and a correspondent who is struck by the figures then given asks:

How close should the potatoes be planted, and were Mr. Hallock's planted in pieces or whole to get the yield spoken of.

It seems that the subject is of sufficient importance to receive fuller comment here, if only to give a caution. Mr. Hallock grows his potatoes in drills three feet apart and the plants are set one foot apart in the drills. But the secret of his success is due to several causes—"intensive cultivation" tells the whole story. The soil is put in the best possible condition before the plants are set, and they are given all the food they can possibly consume, and of the kind best suited to their necessities.

This is but the beginning. Selection is one of the most important steps taken, and that with a view to productiveness and earliness. Mr. Hallock took up the variety known as the "Early Ohio," the first year of its introduction, having found it well adapted to his purposes, and by systematic selection, annually carried on, he has succeeded in getting a type several days earlier and more prolific than the parent. In his method of selection he had in view the largest amount of tubers, with the least possible growth of vine. The careful observer, on looking over his fields, will be astonished at the smallness of vine of his Improved Early Ohio, when compared with the Early Rose, which he grows to some extent, although it is not as great a cropper.

Why? it may be asked, should Mr. Hallock grow the Early Rose when the Early Ohio is more prolific? Experiment has shown him that where the Early Rose can be grown at a profit, his Early Ohio cannot; that the soil must be in a much higher state of cultivation for the latter than for the former. Another point of importance is that if the Early Rose is given the same cultivation he gives the Early Ohio he would have all tops and no tubers. This shows the importance of selection to suit particular conditions of soil and climate. Mr. Hallock is growing the Early Rose in his rotation of crops on a field he has recently come into possession of, and he says it will be at least three years before he can, with thorough cultivation, get that field up to a degree of fertility that will warrant him in planting it with his favorite variety, after which the Early Rose will not be grown. It is well to say a single trial will not give the success Mr. Hallock has attained; persistent effort alone can give that.

## Our Strawberry Pamphlet.

Owing to an expressed desire by the writer to thoroughly revise his series of articles on "Big Berries for All," it may be early in December before we will be able to issue the booklet. It will be well worth waiting for, however, as we confidently anticipate that it will prove the best treatise on the subject ever written, and practical to the core.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often

**Mushrooms Under Benches.**—Will some one oblige me by information as to the best manner of building a mushroom bed under bench (30x8) in lettuce house, a 2-inch steam main runs under this bench, no others. I desire to put in a bed as soon as possible in the most expeditious manner.—JAMES L. CARBERY, D.C.

**A Yellow Canna.**—Kindly give in AMERICAN GARDENING the name of Canna of which I enclose a blossom. It is one of a lot of seedlings which I raised this year from seed taken at random from a bed of French Cannas. The plant is dwarf in habit (18 inches to 2 feet), and a very profuse bloomer.—J. E. G., Md.

—Cannas do not come true from seed and great range of variety may be had by raising one's own seedlings. The blooms sent are of a deep Indian yellow and show the smallest amount of red of any Canna we recall to mind. It seems to us you have a desirable and distinct thing.—Ed.

**Gardening in La.**—Concerning the remarks in All About the Home Plot August 20, I planted radish Giant Stuttgart and Strasburg. I had raised peas McLean's Extra Early; after peas were off, the ground was spaded again and sugar corn planted. I think it was Cory's White Cob; after the corn was used up the ground was cleaned off again, and September 20 the radish seed were planted in drills opened with the corner of the hoe. I sprinkled ashes pretty thick in the drills, then a sprinkling of top soil, then the seed, lightly covering with top soil. I pulled the first radishes on October 3, fine ones three inches long and an inch thick. Only one rain fell after the seeds were planted. I find little difference in Stuttgart and Strasburg radishes. I always use ashes in the garden, but always put it in under the seed. I use the coffee grounds, tea leaves, and egg shells with the ashes; I open trenches a foot or more deep and put all leaves, pecan hulls, and other litter in, stamp it in well, then throw the soil on. This keeps the soil in good order for almost anything. In my little "patch" I raise all the corn, beans, peas, lettuce, radishes, peppers, and onions we can make use of, and often have enough to give to some of my less fortunate friends. I planted peas to-day; we may have a mess for Christmas, or a cold snap may get them.—MARGARET E. CAMPBELL, La.

**What Ails this Apple Tree?**—What is the trouble with my apple tree? I have a large vigorous tree standing on high dry land, at the edge of my vegetable garden; soil sandy but well-cultivated and fertilized. The variety of apple is King of Tompkins Co. The tree bears every year very well, but the apples begin to fall badly when nearly grown and those that hang on are few of them good. They look smooth and handsome enough but when cut open more or less of the inside looks as if it had been slightly frozen, or as a partly roasted apple looks when cut open. They are so poor that we use none of them, and although the tree can easily bear four barrels a year, I shall cut it down this winter. Years ago the apples were all right and sound and kept till spring. Some six years ago I put an iron rod through the tree to prevent its splitting apart. Do you think the iron rod causes the trouble?—E. A. SHAW.

**An Unruly Rose.**—In nearly all old gardens here are Roses called St. George. They are among our very best Roses; the foliage is smooth, dark, shining green; flowers often come in clusters of three, sometimes one on a stem will be vivid crimson, another paler, with very light center; still another mottled in pink and

red. The flowers are Camellia-shaped and last well. Now two years ago one of my big bushes was badly injured by the unusual cold snap in February and a good part of it died. I cut it back to near the ground; when it began growing in spring it threw out long nearly smooth vines that are now 25 feet long, branching and going everywhere, but there has never been a Rose on any of the vines. Near the ground on short new growth it has bloomed just the same as usual. This Rose is not Greville or Seven Sisters, but a Rose that blooms ten months in the year. I have let this one alone as I have other St. George Roses, but if it does not behave better I shall cut off all vines.—MARGARET E. CAMPBELL, La.

**Sow Bugs.**—On page 717, I see a query from W. F. Preston, Ill., for advice on wood louse and answer. Now with all due respect to the entomologists, I should advise them to take a little practical experience with these pests before being so certain. Having grown cucumbers for years, especially the tender forcing varieties, I can positively say that the wood louse does, and will, eat the leaves, fruit, and flower of the cucumber, especially so in frames, as they can remain under the leaves undisturbed in the day as well as night, when they destroy a large percentage of the fruit. Their favorite food is the flower, and fruit in that stage is easily damaged. The remedy I have for years, and still practise, and I could not do without, is toads, (not frogs, some people get these two confused). Toads as a rule can be found in most dry rubbish heaps, and if placed in greenhouse will eat the sow bug or wood louse. It may be interesting to the inexperienced, to learn how these toads take their prey; they partly bury themselves in the soil, just their heads above, and when the wood louse comes their way, even if six inches off, they open their mouths, and thrust out their tongues which seem to act like a magnet, and draw their victim in. Now as regards quantity, that depends on the amount of wood lice, if they are very bad put in as many as you can get, as food diminishes they can be taken out in accordance, or they will get out as opportunity presents itself, but if one would not be bothered with wood lice, always keep some toads on hand.—WILLIAM ELDRED, San Francisco.

## Botanical Study in Detroit, Mich.

President Parker and Commissioner Hoyt and Superintendent Coryell of the park board, Principal F. L. Bliss of the high school, and W. W. Tracy, horticulturist for D. M. Ferry & Co., have been discussing a proposition to turn the central high school grounds into a sort of botanical garden. The park board, of course, has no jurisdiction over the property, but the plan is in the line of that proposed not long since for carrying out future improvements in the parks with a view to making them as useful as possible for the study of botany. The members of the park board have had under consideration an informal plan to improve the balance of the Boulevard, by setting out trees and shrubs in groups of families.

## How to Recognize the San Jose Scale.

In looking for this insect most persons will pass it by unnoticed on account of its very small size. The female scale is only about one-twenty-fifth of an inch in diameter, while the male is only about one-half that size. The shape of the female is nearly circular, while the male is more elongated. The female is sharply convex or conical in the center. This last character will help to distinguish it from many of the other more common species. Its color is nearly like the bark on which it is found. Another distinguishing character is found in the reddish discoloration of the bark, immediately surrounding the scale, extending through both the outer and inner bark. These characters will enable one with an ordinary pocket magnifying glass to readily detect the presence of the insect.—Bulletin of Purdue University, Ag. Ex. St'n.

## Cost of Raising Strawberries.

To the Editor of American Gardening.

I have read with much interest the "Big Berries for All," by Mr. Henry Jerolaman. As I am about on par in many respects to Mr. Jerolaman in being a leading grower of fancy strawberries for a fancy trade of about the same extent in this section, I am very anxious to find out just how much more he knows about growing strawberries than he is willing to tell through AMERICAN GARDENING that I do not now know; for though I am reckless enough to claim to possess much more knowledge than the average strawberry grower about the business (which has been quite fully demonstrated in the past six years), I am willing to confess that what I really do know about the business would not make near so large a book as that which I do not know, and which is possible to be learned by the most intelligent persons; and that if I should live to continue in the business twenty years longer, I should more fully realize the truth of this than I do now.

My fancy strawberries are all grown for one most reliable commission and retail house in Boston, having branch summer stores at North East and Bar Harbor, Me. The price which I receive for this fruit in all these markets is nearly double that given by the most reliable market quotations at the time. Mr. Jerolaman's secret about "gloss" was not so much a secret as he supposed, as I had discovered it six years ago, and have profited by the discovery ever since. I do not agree with him, however, that it can only be accomplished by mulching, as I can grow just as glossy berries, though not so clean, without mulching, that is, in the way that he would have you understand. Mulching has only an indirect effect in producing this gloss. It only induces certain conditions which are part of the necessities to produce it, and the other parts must be present in order to make mulching effectual in any great degree for this purpose. It is plain to see that by the method of culture thus far described by Mr. Jerolaman, these conditions are likely all to be present; but not so with the average strawberry grower, who grows his strawberries in the matted row. The time that Mr. Jerolaman sets his plants, which appears to be some time soon after the first of September, where layer plants are used, certainly would not be practical for fruit growers in more northern sections with the expectations of getting even a paying crop the next season.

Mr. Jerolaman gives us to understand, on page 651, that he can grow a crop of strawberries ("first class") including cost of preparing land, fertilizers, labor and all, ready for the harvesting, with much less cost than any other crop that is grown, not even excepting hay. Just below he tells of how he received about \$300 for one picking of strawberries from about one-quarter acre; and then asks: "Can any farmer or fruit grower show a profit like that from a single picking from so small a place?" I think that I can safely answer for them all, No!!!

On page 667 he says: "I have given you my mode of culture for a whole year, and if you follow it, that is, set out plants in clean rich soil, keep clean, mulch in winter if the ground heave by action of frost, mulch between rows in spring, pick, eat, or sell your fruit, that is all there is in strawberry culture; you cannot fail in strawberry culture unless you have or get poor varieties of plants. Simple is it not, and plain, all summed up in less than three lines?" Now, he does not say one word about cutting runners, and it would seem by the way he says it that there were no runners to be cut during the whole year, so we are obliged to presume there were none, which explains, in part, why he is able to grow the crop so cheaply. His profits are indeed marvelous, and I hope he will tell us very soon just how he is able to do it; for to grow a really first-class crop of strawberries, it costs me, ready for the gathering, upwards of \$200 per acre.

E. W. WOOSTER, Me.

[In a later issue these points will be discussed.—Ed.]

## There is Not a Home in the Land

But calls for a yearly Calendar.

Every family tries to get one or more; generally more.

## There are Calendars and Calendars

Some are good, some bad, most of them indifferent.

## There Will Not be a Calendar Issued for 1898

To exceed in artistic elegance, finish, beauty of designs and effective coloring, the one we to-day offer as a premium to every subscription to AMERICAN GARDENING received before December 31, 1897.

# EVERY SUBSCRIBER IS ENTITLED TO ONE

AND CAN EASILY EARN TWENTY.

OUR magnificent **Rose and Girl 1898** six sheet Art Calendar, two months to a sheet, each sheet  $8\frac{1}{2} \times 11\frac{1}{4}$  inches, is superbly lithographed in eleven colors, and printed on hammered paper; the whole tastefully tied with silk bow—undoubtedly a work of art fit for the most elegant home, and as handsome a Calendar as was ever published. Each one of the six designs presents a distinct type of female loveliness and a fresh study in roses, the coloring on each sheet being rendered in harmony with the design. There is not a line of advertising on the Calendars to detract from their value. They will not be sold by us for less than \$1.00 each.

### Who is Entitled to a Calendar?

EVERY SUBSCRIBER renewing before December 31, 1897, enclosing Five Cents additional to pay packing and postage.

EVERY NEW SUBSCRIPTION—To induce people to test the value of AMERICAN GARDENING we will send the Calendar absolutely free to every name received direct not previously on our mailing list. Remit \$1.00 for A. G. 12 months.

EVERY ONE sending us a club of Four 3-month trial subscriptions at twenty-five cents each, will get a Calendar, free as a premium, by return mail.

EVERY NEW name sent in by an agent.

NOTE.—We have ordered manufactured for us a large stock of these superb Calendars in the endeavor to have sufficient supply for all demands, but will not guarantee to fill orders after supply is exhausted. Therefore, order yours now.

### Special to Agents

A copy of our Art Calendar to show people will clinch the argument and obtain the subscription. Bona fide Agents will be mailed one copy, securely wrapped, on receipt of only Twenty-five cents (one-fourth its value.) Armed with this superb Calendar we misjudge human nature greatly if any ordinary mortal cannot secure a big list of new subscriptions every day. Every new subscriber you send us gets a Calendar by return mail.

### We Pay Agents

Every new subscription at \$1.00 entitles the agent to Five of the Wonderful Henry Strawberry Plants, to be delivered next Spring. Thus 100 new subscriptions would secure agents 500 plants; a possession worthy of your consideration. Every new subscriber taken by agent will receive one of our Art Calendars free by return mail.

Agents who do not want the Henry Strawberry Plants can retain as their payment 20 cents in cash on each subscription they take, or will be credited twenty-five cents on any book, magazine or publication they wish to obtain through us.

PRIVATE GARDENERS.

**Appointments and Doings.**  
Gardeners and others knowing of recent appointments and movings are requested to forward particulars of the same for publication in this column. No charge is made.

**New York.**  
The horticultural display at Madison square Garden of the American Institute as now closed. C. W. Ward, Queens, N. Y., made a grand display of carnations last Saturday, for which he was awarded the Medal of Excellence. Certificates were also awarded to his new varieties, Mrs. James Dean, Gold Nuggets, New York, and Maceo. The palm for apples during the whole show must be given to E. Boggs, of Waynesville, N. C., his specimens were superb.

**A Woman Head Gardener.**  
Some time back we recorded the fact that the authorities at Kew Gardens had opened the portals to women students as well as to young men. One of them as been appointed head gardener to J. Brogden, Esq., of Iscoco, Ferry Side, Wales.

**Newport, R. I.**  
An enthusiastic meeting of the Horticultural Society was held Wednesday, October 27, and twenty-one new members were elected.  
Among the exhibits were; from Robert Laurie, gardener for C. Vanderbilt, Esq., ample bloom of new Chrysanthemum Peter Kay, Nerines, and Begonia semperflorens roseum giganteum.  
From Andrew S. Melkie, gardener for F. E. Wells, Esq., came a splendid vase of long-stemmed Gardenias, and from John Allan, "Caswell's" collection of Chrysanthemums. The awards were as follows: to Robert Laurie for new Chrysanthemum Peter Kay, a bronze medal; for vase of Nerines, certificate of merit; Andrew S. Melkie, for vase of Gardenias, a bronze medal for superior culture; John Allan for collection of Chrysanthemums, at blooms, honorable mention; to Thomas Beattie a similar award for strawberry, Four Seasons, in fruit.  
At the next meeting, November 10, Arthur Griffin, gardener for J. J. Van Allen, Esq., will read a paper on Chrysanthemums.

**Chrysanthemum Society of America.**  
**Seedlings.**—The committees judging new seedlings will be in session this and every Saturday up to and including November 27.  
Exhibitors should make their entries (a fee of \$2 is charged for each variety exhibited) to the secretary, not later than Tuesday of the week in which the blooms are to be shown.  
Blooms may be sent to any of the following addresses, express prepaid:  
Boston.—A. H. Fewkes, Horticultural Hall.  
New York.—Eugene Dailledouze, care of New York Cut Flower Co., 121 W. 23d street.  
Philadelphia.—Edwin Lonsdale, 1514 Chestnut street.  
Cincinnati.—B. Witterstaetter, corner Fourth and Walnut streets.  
Chicago.—W. N. Rudd, room 202, 185 Dearborn street.  
**Secretary's Official Report.**  
Below I give reports of chrysanthemum committees' work for the 28th Inst., as far as received:

**NEW YORK.**  
**Miss Clara Nevin.** Exhibited by Wm. Illenbrecht, Union, N. J., Japanese Rexed, white. Scored 72 points.  
**Peter Kay.** Exhibited by Robert Laurie, Newport, R. I., Japanese, amber-bloss. Scored 87 points.  
**Solar Queen.** Exhibited by E. G. Hill Co., Richmond, Ind., Japanese, yellow. Scored 86 points.  
**H. W. Longfellow.** Exhibited by E. G. Hill & Co., Japanese incurved, white. Scored 82 points.

**Australian Gold.** (Importation). Exhibited by E. G. Hill & Co., Japanese, light yellow. Scored 91 points.  
**CHICAGO.**  
**W. H. Longfellow.** Exhibited by E. G. Hill & Co., Japanese incurved, white, pink shadings on lower petals. Scored 85 points.  
**R. W. Emerson.** Exhibited by E. G. Hill & Co., Japanese, white, shading to yellow at center. Scored 80 points.  
**Australian Gold.** Exhibited by E. G. Hill & Co., Japanese incurved, light yellow. Scored 77 points.  
**Solar Queen.** Exhibited by E. G. Hill & Co., Japanese incurved, light yellow. Scored 88 points.  
**Mrs. O. P. Bassett.** Exhibited by Bassett & Washburn, Hinsdale, Ill., sport from Mrs. H. Robinson; light yellow. Scored 85 points.  
No blooms were presented at Philadelphia and we have no report from Boston or Cincinnati.  
**ELMER D. SMITH, Secretary.**

**Nov. 20—BOSTON, MASS.:** Horticultural Society's Prize Exhibition, Horticultural Hall. Robert Manning, secretary.  
**Not Fixed—SAN FRANCISCO, CAL.:** California State Floral Society. Emory E. Smith, manager.

**The Ideal Park Superintendent.\***  
It may seem presumptuous for one who has never been a park superintendent to attempt to give the qualifications needed for such a position. Undoubtedly practical experience would add to one's ability to speak with authority on this subject, but I may claim such ability as comes from being engaged in a similar calling—from having great admiration for parks, from visiting many such institutions, and from studying what has been written on landscape gardening as well as the actual landscape effects.  
When Mr. Egan asked me to prepare this paper he inclosed a slip on which was written "What are the qualifications for an ideal park superintendent? As the ideal combination can probably never be found in one man, which qualities can best be spared? Which are of the greatest importance? What is the relative importance of the various essentials, such as engineering, tree planting, administrative ability, etc?"  
A park superintendent should first  
\*Read before the Chicago, (Ill.) Horticultural Society, by O. C. Simonds, on July 10, 1897.

## THE CELEBRATED FOLIO MUSIC BOOKS

NO other series of music books published  
ever attained the popularity enjoyed by  
these famous collections; and this is deservedly  
so, for no other collections contain an equal  
amount of the finest music found in these vol-  
umes. There is not an unworthy collection in  
the whole series.

Any of the first nine volumes in this list will  
be sent, postpaid, on receipt of 65 cts. each.

<b>The Song Folio</b> Vol. I., 207 pages. 115 popular songs.
<b>The Song Folio</b> Vol. II., 207 pages. 109 vocal gems.
<b>The Song Folio</b> Vol. III., 207 pages. 85 beautiful lyrics.
<b>The Song Folio</b> Vol. IV., 207 pages. 107 real favorites.
<b>Folio of Music</b> Vol. I. 91 popular pianoforte pieces.
<b>Folio of Music</b> Vol. II. 90 popular pianoforte pieces.
<b>Folio of Sacred Music</b> 64 sacred solos. All voices.
<b>Folio of Piano Duets</b> 42 four-hand pieces.
<b>Folio of Bass and Baritone Songs</b> 88 splendid songs.
<i>Any of the following volumes sent, post- paid, on receipt of 50 cts. each.</i>
<b>The Song Folio</b> Vol. V. 41 New and standard favorites.
<b>Sacred Song Folio</b> High voices. 39 standard works.
<b>Sacred Song Folio</b> Low voices. 46 standard works.
<b>Folio of Organ Music</b> 58 compositions.

ANY piece or book of music published in  
any part of the world can be procured  
of us at shortest notice.

Mention American Gardening when you write.

We solicit from our readers notes of experi-  
ence and observation. While our space is  
limited we will always manage to make room  
for any communication that contains germs of  
real, practical value to fellow-subscribers.

of all be honest, reliable, conscientious,  
gentlemanly—in short, be a man of  
good character. The people's money,  
which he spends, should secure the best  
results for the people. If it goes for  
material it should be for the best qual-  
ity and the greatest quantity that  
the amount expended will command;  
if for labor, the work done should  
correspond with the wages paid.  
But all this is so generally admitted,  
and is true of so many other callings,  
no time need be spent in its demonstra-  
tion.

Next to good character comes a  
knowledge of what a park should be.  
A superintendent should know for what  
purpose the thing he superintends ex-  
ists, what should be its leading features  
and how these can be preserved or at-  
tained. He should know that a park  
exists, primarily, for its beauty, for its  
varied scenery, for its contrast with  
city streets, and for the rest, the recre-  
ation, and the pleasure that is given by  
this beauty with all its various modes  
of expression.

In some cases the superintendent is  
also the designer, and then he should  
know the general plan of the park is  
of more importance than any single  
feature. If a building is to be erected  
it should not be placed where it will cut  
off an important view; if a tree is to  
be planted it should stand where it will  
improve the landscape rather than  
where it will compete with other trees;  
if a road is to be made the superin-  
tendent should know, first, where to  
place it and then how to construct it.

If he cannot have both kinds of  
knowledge he should have the first, and  
get some one else to build the road,  
since there are a dozen who can an-  
swer the question, "How?" to one that  
can answer the question "Where?" If  
there be grading to be done he should  
undertake it with the feeling of an en-  
gineer, since the shaping of park sur-  
faces is more nearly allied to sculpture  
than to the building of railroads. If  
people give a monument, a fountain or  
a relic of any kind and it must be ac-  
cepted, he should know how to subordi-  
nate it to the general effect desired.

But in most cases the superintendent  
will be required to carry out the design  
furnished by some one else. Even then  
it is important he should know some-  
thing of the principles of design and  
should have a knowledge of trees,  
shrubs and flowers, with their various  
requirements; he should appreciate the  
value of large open spaces and varied  
outlines; he should know what consti-  
tutes a good road, when it has good  
lines and proper construction; he  
should know how to make the border of  
a lake appear natural and interesting.

To put the whole matter briefly,  
a park superintendent, in order to fulfill  
his duties in a satisfactory manner,  
should have some knowledge of land-  
scape gardening. This is just as im-  
portant as it is for a man who con-  
ducts an orchestra to have some knowl-  
edge of music. The conductor may not  
be able to compose an opera, but he  
should be able to appreciate a good  
composition; and putting a man in  
charge of work required to maintain  
and create beautiful scenery who has  
no special knowledge of landscape art  
would be like asking a man who cannot  
beat time or tell one tune from another  
to act as leader for an orchestra.

It is, to be sure, an advantage for a  
park superintendent to have some  
knowledge of engineering. He should  
know how to put in drains, water pipes,  
build roads, walks, and do all the var-  
ious kinds of engineering work usually  
needed in the construction of a park.  
He should also know how to prepare  
the various plans and records of such  
work that may be needed for reference.

I believe this knowledge can be  
gained by the person who has also the  
desired acquaintance with landscape  
gardening, but if the superintendent is  
to be deficient in either line the defi-  
ciency can be most easily supplied from

(Continued on next page.)

other sources if it is lack of knowledge of engineering.

The ideal park superintendent should be thoroughly in love with his work. I have known a number of such men. One had charge of a large tract of land, which was really a public park, although it was not called such, and was not managed by a City Council or by park commissioners. I remember visiting him many years ago; he would call my attention to bits of scenery, the border of a lake, an undulating lawn, or a distant group of red pines, by reflecting them in a mirror which he carried for the purpose, and which framed in and separated the view in question or the picture being examined. He showed these views with as much pleasure as a mother would exhibit in showing her baby.

Again, on going to see him early one morning, I found him greatly interested in a ravine drive. He had actually been laying an important drain with his own hands. On another occasion, at his office, he took great pleasure in showing his various books which treated of landscape gardening and birds. I know another superintendent, who is still living, who for many years was in the employ of the late Henry Shaw, of St. Louis, and who still looks after Tower Grove Park, who shows as much interest and affection for his lawns, trees, shrubs and lilies as a parent would show for a child.

But this deep interest, which is so essential for producing the best results, cannot be expected from a man whose position is insecure; from a man who may be discharged when the other party gets in power. The ideal superintendent should expect to spend his life with the park he cares for. The park is to continue for generations. Many of the effects desired will require years of growth for their production.

It takes time for a man to become acquainted with the various features of even a small park, so the one in charge should have no fear whatever of being replaced by another man; his whole thought should be given to the park, and, moreover, since he is responsible in a large measure for the manner in which the park is conducted, he should have absolute control of all the employees in the park—the laborers, gardeners, policemen, etc. He is called upon to make estimates of what certain work will cost and then is required to execute the work. It is unfair to him to require him to use men hired and controlled by some one else.

In the selection of employees he will satisfy himself in regard to an applicant's ability to do a needed work, but will not inquire as to his nationality, his religion, or his politics. The fact that man is a Buddhist, Presbyterian or agnostic would probably not interfere with his doing a good day's work at mowing grass.

The superintendent should have authority to discharge at once any man who showed no interest in his work; who worked rapidly when some one was looking at him, but rested most of the time when he thought himself alone; who talked too much with his fellow-employees, or attempted in any way to make them discontented.

The ideal superintendent would in time become acquainted with all the workers in the park, and take some interest in them aside from securing the greatest amount of work for money expended. A word of explanation now, and then, calling the attention of a mere laborer to the beauty of a tree or shrub; the statement of an interesting fact in natural history; or possibly a bit of political economy, would give the workman food for thought, and help deprive his labor of a little of its drudgery.

On the other hand, the superintendent can often help to educate the Park Commissioners, or, if fortunately one of the commissioners should be a man of good taste the superintendent should show a readiness to learn and profit by any advice that may be given.

But, although the ideal park superin-

tendent will have an intimate knowledge of the design of the park and be brought in close relations with the Park Commissioners and his fellow-workers, his greatest influence will come from his relation to the public. The park exists for the residents of a city and those who come to visit them. It is a place where people go to get fresh air, to see an expanse of sky and clouds and lawn and meadow, to see foliage and flowers, to get sweet perfume, and to hear the music of birds.

It may be conducted in such a manner as to exert an elevating influence on all who go to see it, to teach them to respect others' rights, to show them what is in good taste and to give them the purest kind of enjoyment. In the domain of landscape art it should take a leading position, keeping up with the best thought of the times.

### \$100 Reward, \$100.

The readers of this paper will be pleased to learn that there is at least one dreaded disease that science has been able to cure in all its stages and that is Catarrh. Hall's Catarrh Cure is the only positive cure now known to the medical fraternity. Catarrh being a constitutional disease, requires a constitutional treatment. Hall's Catarrh Cure is taken internally, acting directly upon the blood and mucous surfaces of the system, thereby destroying the foundation of the disease, and giving the patient strength by building up the constitution and assisting nature in doing its work. The proprietors have so much faith in its curative powers, that they offer One Hundred Dollars for any case that it fails to cure. Send for list of testimonials.

Address, F. J. CHENEY & CO.,  
Toledo, O.

Sold by Druggists, 75c.

## DO YOU NEED WATCHING?

Or, to put it another way,  
**Do You Need a Watch?**

We sell them, sell them at such an exceedingly low price that you can't afford to go watchless. Got 'em all sizes and styles.

But we'll just mention two:

An Elgin or Waltham Watch, best movement made, hunting case, accurate time-keeper, handsomely engraved, Duesler Case, heavily gold-plated—last for all time. Ladies' or gentleman's size.

We'll send it to your address with privilege of examination. If it's not entirely as represented, send it back—costs you nothing. If you like it, pay the agent express charges and \$6.50. —That's fair. Or this—

A Hunting Case Watch—beautifully engraved case, first-class movement, any size, heavily plated (14k)—looks just like a \$40.00 gold watch—keeps as good time as any of them. Sent to your express agent with privilege of examination—same conditions as all our watches sent out—and if you like it, pay him \$3.45 and express charges.

If you take our word for it, and send money with order, a handsome chain goes with either, and express charges are paid by us, for the prices named above.

## ALL ABOUT THE HOME PLOT

POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

### Lilliums in Pots.

For the average window gardener, who brings judgment to the growing of plants, it is doubtful if there be another subject in the whole range so satisfying and so magnificent, as well as so easy of handling, as some of the Lilliums. It is hardly necessary to say that among them all, looking at it from all points of view, Lillum Harrisi is far and away the best. It is easy to grow, it is cheap, its size is within window bounds, and it gives more bloom and more perfume for the money than any one ought to expect under artificial conditions. And, indeed, if it be potted early, before the bulbs deteriorate, if it be allowed to become well rooted, and if it be not then subjected to too much heat, it seems virtually impossible to fail with it.

It is well to fix in the mind at first the idea that Lilliums are better without fire heat, but Harrisi may be considered a partial exception to this rule, as it will bear considerable forcing. If they can be grown very cool they will scarcely be troubled by green fly, which is, with much artificial warmth, a great pest.

The compost for Lilliums must never contain fresh, unrotted manure, as this always tends to produce disease in the bulbs. A soil obtained by shaking out the earth from a good sod, to which may be added leaf mould, sand, and a small proportion of soot, is perhaps as good as any, and can be prepared from materials at hand, by nearly all growers except those hopelessly shut up in the great cities. To these, the nearest florist will supply proper potting soil.

The habit of growth of the Lillies is a point to be considered on potting the bulbs. Much like field corn, they throw out successive series of stem roots during the growth of the stalk. These are not only feeders, but they help to hold the tall stalks upright, and their needs must be met. First, the pot needs good drainage which may be supplied by almost any rough material, provided that a thin, loose sod, or a layer of moss be placed above it to prevent the soil from settling into the open spaces. With a fair-sized bulb a six-inch pot is necessary, and the bulb needs to be set rather deeply in the pot, but covered at first with little more than a half-inch of soil. After this is shaken down firmly, a layer of loose moss may be placed above it, when the pot may be plunged in ashes outside, or placed in a cellar, and buried in ashes or leaf mould, away from the light.

Florists say that six weeks is sufficient for the hiding-away necessary to produce good roots. Our own practice is to leave them nearer three months, or at least until the top shows signs of being ready for strong, vigorous growth. The pots are then brought carefully to the light in a very cool temperature, the moss being removed. In a few days they are placed in a sunny window, care being taken to turn the pots daily, after the stalk begins to run up. As the whorls of stem roots show successively, layers of the same compost used in potting are added to feed these hungry little roots.

A moderate amount of watering, only when needed, and care to keep down the green aphids if it appear, are all that is now necessary to bring full reward for previous work. The heat may be increased a little, if blooms are wanted earlier, but this is, perhaps, the most dangerous thing for the novice to do. We have bought these bulbs for years, never paying more than 15c. each, and have never had a failure.

Besides Harrisi and its older form, longiflorum, the landfolium Lillies prove satisfactory for potting. Even L. auratum and the beautiful speciosum Melpomene may be grown in this way, but the bulbs cannot be obtained early, nor must flowers be expected early. One of the California Lillies, the yellow Parryi, is offered this year with strong commenda-

tion as a pot Lilly. But there is also strong doubt in the minds of some as to its proving a general success in this direction.

### Poultry Notes.

#### Localities Differ.

One man tells you poultry pays splendidly. Another man insists that it's all bosh; the great money in poultry is the money that's put into it! A third stands, evidently, between the two, and says, "May be." It will generally be noticed that the enthusiast is an Eastern man; that the sceptic is a Westerner; that the man who says "perhaps" is getting moderate prices. But as it happens that price of feed usually goes up or down almost to correspond with prices of poultry in the various localities, there is not the real difference in profits that is found in selling prices. This refers of course, to poultry and its products at market rates. There is always money in fancy poultry, if the raiser is shrewd enough to be able to sell it at what poultry men call "long" prices.

#### Creating Demand.

The men temporarily out of business (and their number is legion) who have taken agencies of various sorts, do not need to be told that the chief part of their instructions relates to creating a demand for their wares. The shrewd advertiser, too, creates a demand, where none before existed. This creation is the essence of success, in a large number of lines of trade. The poultry raiser needs to learn this trick; and since his products are among the necessities, his part of the trick will consist mainly in producing stuff so good that consumers come to him again and again. Thus trade is deflected his way, and extra coin put into his pocket.

#### Littering the Floors.

From the moment the fowls are more or less confined to the houses, they need litter of some sort, either on the main floors or in the scratching yards. Hay, straw, cornstalks, leaves, millet in the straw, any of these may furnish scratching litter, but those are best which contain some fine seeds. Fowls make use of nearly all sorts of seeds, but if there are none in the litter, a small amount of fine grain should be scattered there each day. This will furnish exercise, promoting warmth, digestion, and egg laying. It is a point not to be neglected by those who aspire to a full measure of success.

#### Indigestion.

Whether or not we assent to the statement made that indigestion is the one trouble in the human family, which physicians are called upon oftentimes to treat, we must certainly admit that it is altogether the commonest difficulty among fowls, especially if yarded. A late report of a feeding experiment in which corn alone was given for several successive weeks, to yarded chicks, previously thrifty, showed at its close nearly every bird more or less affected by liver trouble. Mild indigestion (easily curable by the use of sufficient green food and grit, with a varied grain diet) runs almost surely, if neglected, into serious liver difficulty, leading soon to death.

#### A New Scheme for Producing Pullets.

How to get a large percentage of pullets is the great ante-problem of the egg producer. A shrewd poultryman and writer, Mr. John H. Robinson, suggests that individual characteristics of certain birds may yet prove to be the key to the puzzle. He instances a bird once owned by himself which, under three different matings, gave always the same result, five-sixths of all the progeny being pullets. His mates were of the same age, older, and younger than himself, but the proportion never varied. Moreover, the trials were not all during the same year. Here is at least a hint to note conditions closely when an excess of numbers of either sex is produced.

#### Fighting Lice.

A great many people complain that they still have lice on the fowls while using kerosene and other standard lice

killers *ad libitum* about the houses. Such may, perhaps, not recognize the fact that there are several kinds of lice that harbor only upon the bodies of fowls, and which remedies applied to the houses and perches cannot reach, unless of the kind that give off fumes. The caretaker must therefore provide some agent for removing vermin from its shelter among the feathers. The fowls will attend to this themselves pretty faithfully, if given an abundant dust bath of loose and very dry earth, which may be made more effective by the addition of carbolic powder, or tobacco dust. If the box containing this be set in a sunny place, the birds will patronize it with evident pleasure at all hours of the day.

#### Whitewashing.

There are many poultry raisers who get along entirely without the use of whitewash. But it is certainly one of the most helpful adjuncts to success with fowls. In the form of thin cream, it is easily applied with a small force pump. It not only sweetens the quarters as nothing else will, but the reflection from white walls makes the pens appreciably lighter, and thus adds much to the comfort and welfare of the fowls. Lime in every form is an enemy of vermin. And it seems as though every argument were in favor of the use of whitewash. We have never heard one against it, unless the fact that it is some trouble to use it may be considered such.

## SOME BARGAINS IN CLUBS

FOR

Men, Women and the Young.

**Ohio Farmer**, a giant among the agricultural weeklies, and American Gardening. The two, one year, For \$1.60.

**Farm, Field and Fireside**, a \$2 to 40 page weekly Farm and Family Journal, the best of its class, and American Gardening. The two, one year, For \$1.50.

**Country Gentleman**. This weekly amply covers the field its title indicates. Every country gentleman should subscribe to it. And American Gardening. The two, one year, For \$2.75.

**Farm Journal**, the "little giant" of monthly journalism in matters agricultural, and American Gardening. The two, one year, For \$1.25.

**Farm Poultry** (semi-monthly), and American Gardening. The two, one year, For \$1.50.

**Poultry Monthly** and American Gardening. The two, one year, For \$1.25.

Above is your choice of two most excellent poultry magazines. And nearly every one of our readers keeps poultry. Why not subscribe to both? The two poultry papers and American Gardening, one year, For \$2.25.

**Meehan's Monthly**, a horticultural stand-by, and American Gardening. The two, one year, For \$2.85.

**Harper's Magazine**, as good as ever; none better among the literary monthlies, and American Gardening. The two, one year, For \$4.25.

**Ladies' Home Journal**, an unrivaled monthly for women, the standard in its class, and American Gardening. The two, one year, For \$1.90.

**Youth's Companion**, of Boston. At the head of all journals for both boys and girls, and read by the elders, too. New Subscribers Only and American Gardening. The two, one year, For \$2.85.

# OUR CLUB LIST

LET US FILL YOUR ORDERS FOR 1898.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

**FRUITS OF EXPERIENCE.****JOTTINGS FROM OBSERVATION.**

Currant cuttings now.

Sow Pansy seed.

Set bulbs for spring flowering.

Red Jacket proves unproductive with us.

Plant out the best plants and sow the best seeds.

Our grape market was steady and firm, although prices were not high.

Sandy berries are generally the result of the lack of "stir around and mulch."

Our canned Enhance strawberries present a good appearance.

Try the new varieties, but plant most extensively of those tried and found worthy.

Never pack mulch too tightly around the bark of young trees. Leave an air space between bark and mulch.

We prefer to buy our seeds of a strictly reliable seedsman even if they do cost a little extra. Such practice generally gives the best satisfaction and is cheapest in the end.

The bed of flowering bulbs which you are setting this fall will come out in much better shape in the spring if covered with from four to six inches of leaves which should be fastened down with evergreen boughs or any other handy material to keep them from blowing off.

If the old fruiting canes are not cut out of the raspberry hills yet, it would be well to attend to it at the earliest convenience.

An experiment plot of ground on which to test different varieties of fruits, vegetables, and flowers is a good source of pleasure.

The older I get the more I see that an untiring and continuous energy is one of the greatest elements necessary to success in any line of business.

If we have done our work this season better than any time in the past what a pleasure it is to think of the prospects for next season's crops, and the grade of fruit, which we expect to be superior to any in the past.

The quality of the good old Delaware grape this season reminds us of the good days of our boyhood. It is a good standby yet, and at least one vine should be found in every home garden. It has brought as high a price here as the best this season, and really when I come to think of it, I never saw it "begging for a market."

What a fine growth the new plants of the Marshall strawberry have made this season. It is too bad that the parent hill will rust so badly in the latter part of the season. This is the one great objection to this variety; we only wish it could be free from rust, as it is such a fine grower.

Our Dew strawberry plants are growing nicely and making heavy crowns, but we cannot speak as to fruiting qualities, as ours are spring-set plants.

Save all the hen manure and scatter it two inches thick between alternate layers of sod, each six inches thick, late this fall; shovel over two or three times next season and a most excellent fertilizer for the bottom of melon, squash and cucumber hills will be the result. A scoop shovel full to each hill.

If your soil is poor and you wish to grow some fine currant plants from cuttings, procure the cuttings now and set in nursery rows; then with the one-horse garden plow turn a furrow two to three inches deep away from each side of the row, not coming closer than four to five inches to the row. Now fill the furrow on each side of the row one-half full with well-rotted manure (horse manure to be preferred); on top of this hoe back the furrow thrown out, then mulch the surface of the ground close to the cuttings with long or coarse manure about two inches thick to keep them from heaving during winter, and if the soil is of a clayish nature, mulch still more heavily. About May 10th of the next spring, rake the coarse manure between the rows and cultivate once each week and you will

have no trouble in raising nice currant plants, providing you do not plant on ground that is too high and dry.

CHARLES NASH.

## WHOLESALE MARKETS.

### Boston.

Market on most all vegetables is easier, with not much change in figures, although purchases can be made at a little less than a week ago.

Hard-shelled Hubbard squash has been coming freely from Michigan, bringing \$17@20 a ton; Minnesota has also been putting a good many cars upon this market, being mixed soft and hard-shelled; consequently a range of prices from \$12@17 a ton. Near-by farmers supply a certain set of customers each morning with choice narrow at about \$1 a barrel, letting them have Bay State or Turbans at \$1.25 the same quantity.

Choice, well-dried onions are steady at \$2 per barrel; a few cars of green stock, rather of a second grade, caused a little uneasiness a few days since, but stock being finally placed at 25@50c. less, we think it is out of the way and no further scare need be feared. Spanish onions in crates supposed to hold 50 pounds, but do not, selling \$1.50.

No change can be noted in shell beans; demand is light, supply lighter, and a range would be from 50c.@\$1.25 a bushel.

The second crop of Massachusetts peas placed on the market and bring \$2@2.50 a bushel; large majority of consumers, however, are not hungry for peas at this season of year.

White French turnip 75c.@\$1 a barrel, yellow 75@80c., white flat \$1.

Cauliflower steady, fancy 10@15c. a head; mint 40c. a bushel, parsley 50c., radishes 28c. a dozen, spinach 25c. a bushel, parsnips 75c., carrots 75c., beets 50c.

Some new beet greens put on the market yesterday part sold 10c. a bushel, balance thrown away; this will show readers how some things are not wanted out of season.

Florida oranges 150-176 count bring \$4; grape fruit in boxes holding 60-80 each, bring \$6@7.

Cabbages very good demand, 8@4c. each; corn beef and cabbage very healthy diet at this season of year.

Hothouse cucumbers are firmer and higher \$6@8 a hundred; some fancy assorted even bringing more money.

A few red raspberries were brought in from our near-by city of Malden this morning, said to be from a last spring shoot.

Hothouse lettuce has very fair demand, mostly used for decorating the dinner table; outdoor stock finished.

A certain demand for mushrooms at 75c. a pound.

Hothouse tomatoes plentiful, 10@13c. a pound.

Hothouse grapes slow demand, 25@50c. a pound.

Potatoes having a little boom, Green Mountains or Rurals 75@80c.; market getting cleaned of the "sculch" which has been here from different parts of the United States. Red stock is neglected. Hebrons are always wanted, and selling at 82c.

Apple market is in better condition, lower prices about equaling the inferior qualities have caused the street peddlers to take a good many apples and that means they get used up in some manner very quickly. Boom on Ben Davis across the water has excited some of our speculators so that some fancy solid packed Ben Davis have brought \$2.75 in car lots. York State Greenings, better demand, and to-day could quote \$2.50@2.75; some Baldwins are inquired for, but choice cannot be found; those that come here are knotty and wormy. Jonathans and Snow apples \$3@3.50, while some high-colored Gravensteins move off at \$5. There should be a better trade for apples with better prices from now forward.

The lighter arrivals of sweet potatoes caused a jump, and while Jersey double-head barrels bringing \$2.50@2.75, Virginia stock brings \$2.25@2.50 in cloth heads.

The state elections will be settled next Tuesday, and we can all get right down to a better business.

### Philadelphia.

Apples are gradually working into better shape, as surplus stocks have been well cleaned up. Choice to fancy fruit is in fair demand and firm.

Grapes are in moderate supply, and prices rule firm, with a good demand.

Choice Seckel pears are scarce and wanted, the market is well supplied with Duchesses, which are dull and easier in price.

Cranberries are plentiful and quiet, much of the supply consists of soft and inferior fruit.

Apples—Jonathan, choice and fancy, per barrel, \$8.25@8.50; Kings, choice and fancy, per barrel, \$2.75@3.25; Twenty-Ounce, choice, per barrel, \$2.75@3; fair to good, per barrel, \$1.75@2.25; Ben Davis, choice and fancy, per barrel, \$2.25@2.75; fair to good, \$1.25@1.75; mixed varieties, choice, per barrel, \$2@2.50; fair to good, \$1.50@1.75.

Quinces—No. 1, per barrel, \$1.75@2; No. 2, per barrel, 75c.@\$1.25.

Pears—Seckel, per barrel, \$4@6; per bushel keg, \$1.75@2; Louise Bonne, per barrel, \$1.50@2; per one-half barrel, 75c.@1; Duchess, per barrel, \$1.25@2.

Grapes—N. Y. Concord, per 5-pound basket, 7@7½c.; per 10-pound basket,

11@12c.; N. Y. Niagara, per 5-pound basket, 8@10c.; N. Y. Catawba, per 5-pound basket, 7@8c.

Cranberries—Cape Cod, choice to fancy, per barrel, \$5.50@6; medium, color and size, \$4.25@5; inferior, per barrel, \$2.50@3; per crate, \$1.50@2; Jersey, per crate, \$1.25@1.75.

Receipts of potatoes have fallen off and the market for choice stock is firm, with a fair demand. Most of the supply consists of poorly-graded stock which has to be worked off at best price obtainable.

Receipts of sweets have been light, the market being firmer with a good demand.

Onions are very plentiful and in moderate demand.

Receipts of cabbage are light and three has been a good outlet for choice stock at firm rates; Jersey, choice, per 100, \$2.75@3.25; fair to good, \$2@2.50.

Cauliflower—Choice, per barrel, \$1.75@2; fair to good, per barrel, \$1@1.50.

Celery—Choice, large, per dozen, 25@30c.; fair, per dozen, 15@20c.

Cucumbers—Florida, per crate, 50@75c.

Green peas—Per one-half barrel basket, 80c.@\$1.25; Charleston, per bushel basket, 60@70c.

Onions—Per barrel, \$1.75@2; per bushel, 60@65c.

String beans—Virginia, per one-half barrel basket, 60@70c.; Charleston, per bushel basket, 30@35c.

Squash—Hubbard, per barrel, 75c.@\$1.

The trees recommended as being most suitable for planting in New York streets are the Norway Maple, silver Maple, Tulip, Poplar, Carolina Poplar or Cottonwood, and the Oriental Plane tree.

## PHYSICIANS BAFFLED.

**Prof. R. S. Bowman, Instructor of Natural Science in Hartsville College, Cured of a Severe Illness by Dr. Williams' Pink Pills for Pale People after Physicians Failed.**

*From the Republican, Columbus, Ind.*

Prof. R. S. Bowman, the able instructor of natural science in the famous Hartsville, (Ind.), College, is well and favorably known, not only as an educator, but also as a minister of the gospel, as for a number of years he was pastor of the United Brethren church at Charlotte, Mich., before coming to Hartsville,

PROF. R. S. BOWMAN.

Some time ago he had a severe illness which was cured almost miraculously. A reporter hearing of this, interviewed him regarding his experience. Prof. Bowman was in the midst of his work when the reporter called, but he cheerfully gave him a hearing.

"A year ago last fall," said the professor, "I broke down with nervous exhaustion, and was unable to properly attend to my duties. I tried different physicians but with no relief, and also

used many different proprietary medicines, spending almost fifty dollars for these medicines alone. I then succumbed to a siege of the grip in the middle of winter, and was left in a much worse condition. My kidneys were fearfully disordered, and my digestion became very poor. I was indeed in a bad condition.

"A minister in conference learning of my condition advised me to try Dr. Williams' Pink Pills for Pale People. I had heard much about the wonderful curative powers of this medicine, but it was with reluctance that I was finally persuaded to try it, as it seemed that nothing could do me any good. However, I procured three boxes of pills and took them strictly according to directions. By the time the last dose was taken I was almost cured, and in better health than I had been for years. I continued using the pills a while longer and was entirely cured. I can cheerfully recommend Dr. Williams' Pink Pills for Pale People."

Such was Professor Bowman's wonderful story which was further endorsed by the following affidavit.

HARTSVILLE, Ind., March 16, 1897.

I affirm that the above accords with the facts in my case. R. S. BOWMAN.

Subscribed and sworn to before me this 16th day of March, 1897.

LYMAN J. SCUDDER, Notary Public.

STATE OF INDIANA, ss.  
Dr. Williams' Pink Pills for Pale People contain all the elements necessary to give new life and richness to the blood and restore shattered nerves. They are sold in boxes (never in loose form, by the dozen or hundred) at 50 cents a box, or six boxes for \$2.50, and may be had of all druggists or directly by mail from Dr. Williams' Medicine Co., Schenectady, N. Y.

If we could teach the  
Indians

## The Water Garden

BY WILLIAM TRICKER.

PRICE, \$2.00. 25 per cent. off to subscribers to American Gardening  
and Florists' Exchange.

This work contains nine beautiful plates, eighteen full page descriptive  
views of leading Water Gardens and Ponds, and numerous  
smaller pictures prepared with special reference to  
this work. On heavy enamelled paper.  
Elegantly bound. Large octavo.

The text describes all operations from the growing of plants in tubs to the  
large water garden, excavation of grounds, construction of ponds, adapting  
natural streams, planting, hybridizing, seed saving, propagation, the aquatic  
house, wintering, correct designing and planting of banks and margins, and  
all other necessary details.

A. T. DE LA MARE PTG. & PUB. CO. LTD., P. O. Box 1697, New York City.

## Henry Strawberry Plant Premiums

Will be shipped to all who desire  
them this season until ground freeze.

Owing to the wonderful  
run on this un-  
equalled Straw-  
berry we are preparing 100,000  
Henry plants for Spring de-  
livery, and in this connection  
we desire our readers to re-  
member

### Two Facts

1—The Henry Strawberry can be  
obtained solely through a subscrip-  
tion to AMERICAN GARDENING; as the  
publishers will not sell plants under  
any consideration;

2—Neither will Mr. Jerolaman.

## Who is Entitled to Plants

**New and Renewal Subscribers.**—Five  
plants of the Henry will be mailed,  
postpaid, as a premium to every Re-  
newal or New Subscriber sending us  
\$1.00 for a year's subscription. When  
remitting be sure to state if you want  
this premium.

**To Agents and Workers.**—For every  
\$1.00 received from agents and others  
for New Subscriptions, we mail, post-  
paid, Ten Henry plants, Five to the  
New Subscriber and Five to the Agent.

## Special to Club Raisers!

**Clubs of Ten.**—To every agent sending  
us in a club of Ten New Names and  
\$10.00, we will forward in payment  
therefor One Hundred (100) Henry Straw-  
berry Plants, by express, as well as  
send Five plants, postpaid, to each  
person in the club.

Mr. Jerolaman's series of articles has  
been put in pamphlet form; and agent  
will be supplied with copies on appli-  
cation. Best campaign matter out.

Address Your Letters,

**AMERICAN GARDENING,**  
P. O. Box 1697, NEW YORK.

FIG. 215.—A VASE OF CHRYSANTHEMUMS.

The above picture shows a charming use of Chrysanthemums arranged for effect, the balance of the whole group is good and pleasing. The variety is a new early pure white, called Midge, and was grown by C. J. Knott, St. John, N. B., who thinks the variety will come to the front for early use.

## National Experiments in Peach Culture.

The following extract from the minutes of the last meeting of the Association of Colleges and Stations gives the outline of the work to be undertaken:

"A paper prepared for the section by R. H. Price, of Texas, was concluded by the following memorial: In view of the importance of this classification to successful peach culture in the United States, I wish to make the following recommendations:

"1. That a committee of three be appointed to be known as a committee on co-operative work in testing the different races of peaches.

"2. This committee shall consist of one horticulturist from one Northern station, one from one Southern station, and one from one Central station.

"3. The work of this committee shall be to find out, as far as possible, the isotherm in which each race is adapted.

"4. The committee may recommend to as many stations as may be thought necessary a list of varieties from the races, to test and report upon.

"5. The committee shall make out a suitable blank to be printed by the United States Department of Agriculture, and also to be distributed by this department to the stations engaging in the work.

"6. Each station will be asked to pay for its own trees.

"7. The results of this work, together with the description of the races will be written up by the committee, and will be published by the United States Department of Agriculture.

"After being read, the memorial was referred to a committee consisting of Profs. Goff, Mason, and Munson. The recommendation of the committee was that the following named gentlemen be made a permanent committee to carry on the co-operative work of testing the several races of peaches in the various sections of the United States. The permanent committee is as follows: Prof. R. H. Price, Texas; Prof. B. J. Wilson, California; Prof. G. H. Powell, Delaware, and Prof. L. R. Taft, Michigan.

## Arbor Day.

One of the encouraging features of passing horticultural events is the increased interest which is being shown in Arbor Day. I do not remember a time when the day was so largely observed as it was this year, although the drought made the conditions unfavorable.

One of the public school buildings here has been sadly in need of shade; this fall the school board bought 150 trees and observed Arbor Day in a systematic way. A short but interesting program was arranged, a few songs, speeches and an oration. The school children all marched to the building, each child carrying a flag. It was an interesting sight to watch these children pass along to the Arbor Day exercises, each waving an American flag. The teachers and school board were in the procession and all seemed to take an active interest. Many visitors were present, and altogether a very successful time was had.

It is not alone in towns that interest is being awakened, but in the country as well. I know of several school houses where shade trees have been needed for many years, and this year finds the work being done.

There is one discouraging feature about a good deal of the country schoolhouse planting; there is too little attention given to the selection of the tree to be planted. The children are asked to bring in trees, which is all well enough, but in too many cases it seems that proper instruction has not been given, or if given, has not been heeded. At one school house I noticed a bunch of trees, with roots cut close to the body, lying out fully exposed to sun and wind, and from all indications they had been there since the children brought them in as they came to school. The trees doubtless remained so until late afternoon.

At another school house I noticed the trees were well protected from sun and

wind. I may have more to report about these two schoolhouses later. I believe Arbor Day a good thing. Help it on! J. C. FURNAS, Sheridan, Ind.

## Experiment Station Tests of New Strawberries.

There is quite an army of berry growers in the country growing tired of the manner of testing and reporting new strawberries by the experiment stations. By the way the tests have been carried on during the past few years, the originator or introducer of a new berry does not have a fair showing of what might be brought out, were a large number of plants put on trial to make the test.

The rule, as laid down by many of the stations, is to test about a half-dozen plants. Now, after thirty years' experience in berry growing, I maintain that there should be at least 50 plants tested of any new candidate that is seeking recognition. In a half-dozen tests a worthless strawberry may be foisted on the public, or a good one lost.

I would point out another objection to the usual bulletins that are being scattered abroad among the berry growers. It is about the per cent. of quality and productiveness. What do we learn from a bulletin report that runs about as follows: No. 87, quality 5, productiveness 7. Or say, No. 122, quality 7, productiveness 5. Or No. 77, productiveness 6, quality 8. Or No. 17, quality 3, productiveness 6, etc.

The majority of berry growers do not know any more about those new varieties reported as above, than if they had never heard of an experiment station. Now it is my opinion that some well-known old variety should be used in the comparison for measuring the quality and productiveness of all varieties.

In a test of quality, the Downing, or Warfield, might be used. Crescent or Warfield might be used in the test for productiveness. The well-known old Capt. Jack or Warfield might be the ideal for firmness. For comparison in size the Bubach or Marshall should be the standard.

The writer had not the opportunity in his boyhood to get the much-desired education, but he believes that too much classical arrangement of the reports is not what the great majority of fruit growers care to read. B. F. SMITH, Kans.

## Tradescantia Discolor as a Bedding Plant.

It is not generally known that this old-time denizen of the greenhouses makes a charming bedding plant; yet such is the fact. A number of plants were this last season used, mixed with Crotons, in a bed in front of the residence of W. H. Macy, Macy Park, Harrison, N. Y. The whole bed was a charming combination of color.

The Crotons were a grand success; the formation of the bed being square, Mr. John Shore, the gardener, planted the Tradescantias in the angles or corners where they sit well and show off to advantage, and make a more luxuriant growth than indoors. The royal purple of the underside of the leaves becomes more brilliant, and as seen against the bright yellow and other Croton colors, makes a richness and color effect that cannot but be admired.

The Manhattan, Kans., Horticultural Society held its October meeting at the home of Professor J. D. Walters. The papers read were "Nuts That Might be Grown in Kansas," and "Notes from the Gardens," the former by Geo. L. Clothier, and the latter by T. C. Wells.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

## Forcing of Lettuce in Winter.

The winter forcing of lettuce near large cities is a very profitable investment, the crop being in good demand with good prices for the best stock. The New York Experimental Station at Geneva has been at this work growing the lettuces on the bench in one house. My first sowing for the purpose was on September 5, the varieties being Big Boston, Salamander, Hanson, Sunset, Henderson's New York Cabbage, Golden Queen, Golden Ball, and Grand Rapids, and 70 dozen were sold by the end of December. All the varieties advanced to the highest perfection and were as good in quality as any I have grown in the open air.

Big Boston is rather coarse, but if given plenty of room and allowed to head, it is a fine lettuce for market. Salamander is a fine forcer, but subject to mildew. Hanson forces well and is good for market. Sunset is a good curled lettuce and keeps well. Henderson's New York Cabbage lettuce forces finely; heads better, and is much lighter in color under glass than outdoors. Golden Queen is very early, and a good forcer, but the heads are small. Golden Ball is a handsome early lettuce, heads well, and has a good color. Grand Rapids is one of the best curled lettuce of its class, handsome color, a good forcer, and fine for market. Drumhead is a good forcer, a large upright head, light color, and keeps well. New Iceberg lettuce is very fine, resembles Grand Rapids, but is not so curly; fine forcer, keeps well; good market variety. Tennis Ball is a fine forcer, makes good heads quickly, and is a fine market variety. All the above have been marketed from the station and have proved themselves, without exception, to be fine market varieties.

My plan in growing winter lettuce is to sow the seeds thinly in small plats and when fit for transplanting, I prick out singly into pots, two and one-half inch size, and plunge them in the benches to remain until fit to market. The distance from each pot is ten inches every way, and I find that by confining the roots in those small pots the lettuce heads better and sooner than if planted in the ordinary way. The small pots cost \$3 per thousand, and when shipping my lettuce to market, I pack in trays in damp Sphagnum moss, without removing the pots. The lettuce thus keeps fresh for a long time, and I can command a larger price and get the first sale.

The proper temperature to produce first class lettuce is from 50 to 60 degrees, and at all times in favorable weather admit abundance of fresh air. Water should be given freely on all bright days overhead with a moderate sprinkler; and after dark weather, when the sun shines brightly, the lettuce should be sprinkled lightly overhead two or three times daily.

Before planting lettuce finally in the benches, turn the plants upside down in your hand and dust some finely powdered tobacco on the under sides of all the foliage; this will prevent insects getting on them. By proper attention to ventilation, and an occasional dusting of tobacco powder on the leaves as the growth advances, the crop will be kept clean and healthy.

The benches should be six inches deep, with two inches of well-decomposed manure in the bottom; the remainder being filled with good fresh loam prepared in this way: Three shovelfuls of loam to one of leaf mold and one of sand. In this preparation I grow lettuces all winter and my last crop is as good as the first. I use a light dressing of bone meal at each planting, lightly sprinkling over the surface of the soil.

Every two weeks I sow five or six varieties in small plats and as soon as fit for transplanting into small pots, they are planted and plunged in the benches immediately. As one crop is removed another crop takes its place, and no part of the bench is unoccupied.

Six successful crops of lettuce can be raised easily throughout the winter.

WILLIAM THOMPSON.

### An Unruly Rose.

The Rose of M. E. Campbell described in the last issue of AMERICAN GARDENING was undoubtedly budded upon the stock of some climbing variety. Freezing and cutting back caused new shoots to be sent up from below where the bud was inserted. These shoots should be cut off near the ground. By so doing the sap will be thrown into the budded portion which ought to grow and blossom as before.—W. E. BRITTON, Conn.

—It seems very probable that the Manetti stock on which the plant is worked is growing out and making leads. These should be removed at the point of emergence. The accompanying sketch will explain better than any words: *a* and *c* are the Manetti and *b* the growth from the bud. The suckers from the Manetti stock

FIG. 216.—HOW BUDDED ROSES SUCKER.

have leaves of seven leaflets and show a reddish tinge. It is fatal to allow them to remain. In planting budded stock care must always be taken to plant deeply.—Ed.

### Mushrooms Under Benches.

—Making a bed under the bench in the lettuce house as suggested on page 768 is practicable and, with the space at the disposal of the writer, good results should be obtained. One objectionable feature is the steam pipe, unless that be so placed as not to interfere with the bed, otherwise it must be boxed up or kept from the manure in some way; if not it will dry out the bed too much, and wherever it becomes dry in this manner no crop can be expected. How to make and prepare mushroom beds has been treated on in full in previous issues of AMERICAN GARDENING, even so recently as on page 744.—Ed.

### Sow Bugs Do Eat Plants.

In your 16th of October number, page 717, in answer to W. F. Preston's inquiry in regard to sow bugs, you state that it has never been sufficiently demonstrated that the sow bug eats the living tissue of plants. Any farmer or gardener in this community who is anyway observing will tell you that the sow bug does eat and injure plants, that it is very bad on celery where boards are used for blanching and a great nuisance where potatoes are piled up on the peat land. We have seen the whole inside of potatoes destroyed by sow bugs and found the cavity full of both old and young bugs; they will even eat the shell of Hubbard squash if that be left on the ground very long after ripe.

To be sure we were right as to the right name for the bug, we took some specimens to our Farmers' Institute and had them identified by Prof. A. J. Cook, president of Clairmont College (Clairmont, San Bernardino Co., Cal.), acknowledged as the leading entomologist of the Pacific Coast and moreover he says that they do eat vegetation.—S. J. MURDOCK, Orange County, Cal.

The first building ever devoted to the training of young colored men in agriculture, horticulture, dairying, and so on, is to be opened as a department of the Tuskegee (Ala.) Normal Institute next month. Its establishment is due to the generosity of Messrs. Morris K. Jessup and J. L. M. Curry. Since 85 per cent. of the Southern negroes depend upon agriculture for a living, this is an experiment in philanthropy of a very practical kind, and its outcome will be awaited with intense interest.

## The Vegetable Garden.

### Improving the Plan.

—Small villa gardens are often cut up into small plots with more walks than are necessary. If the edging is formed of sod one foot wide, as is frequently the case, it necessitates much labor to keep it in place and trimmed, without which it will always look untidy. Rearrangement in the general plan of the vegetable garden can now be made with advantage; if the ground plan is well arranged, it is much easier to take care of.

All herbaceous plants and small fruits that are likely to remain in the one place for years, should always be at one end together, where they will not interfere with the work of the plow. It does not look well to have a strawberry patch, or an asparagus bed in the middle or sage in one place and the thyme in another. Each class should be planted in one place convenient and handy.

### Fruit Trees Not Advisable.

It is not advisable to plant any fruit trees within these limits, they can be managed much better if they are planted outside, they rob the garden too much, and few things will do well in their immediate vicinity. Besides this, tall growing fruit trees will make too much wood for fruiting, if growing in a well-enriched garden. Fruit trees, kept within bounds, trained to a trellis, may be permitted on each side of the main walk, and if properly pruned and cared for will not only look well, but will be an interesting feature of the garden.

In places where it becomes necessary to set fruit trees in the vegetable garden, it is much better to select for the purpose, those growing on dwarf stocks; these can be planted six feet apart and will not grow larger than can be conveniently reached from the ground. These have also the advantage of coming into bearing in two years after planting, for this reason they are more satisfactory for private use. Those contemplating the laying out of a new garden should be careful about their plans being perfect before starting.

### How to Lay Out the Garden.

Our ideal method of laying out a garden of one acre would be about as follows. Choose good deep fibrous loam, if not naturally well drained it should be made so artificially. The ground should be as near square as practicable, level, or sloping easily towards the south. Do not plant a privet or any other hedge round it, as it takes too much nourishment and moisture out of the ground; a nice wall is the best protection for a garden, it will make it warmer and earlier in the spring, and could be utilized in training against it such things as tomatoes.

Have as few walks as possible. Make one good walk through the center, wide enough for a horse and cart; if convenient to the approaches, arrange this to run east and west, that when the crops are planted across the patches, the rows will run north and south, which is the correct method to plant, as the sun then shines on both sides of them equally, a matter of some import. A narrow border may be made near the north fence to plant early vegetables by making a cross walk.

Place a hydrant on the edge of the walk near the middle, as water is quite a necessity in the garden during the summer. In large gardens there should be a hydrant at each intersection of walks, iron pipes are much cheaper than hose piping; the latter will last one season, the former a lifetime.

### Useful and Ornamental Edgings.

For edging the plot a nice sod is perhaps as neat as anything if kept cut and trimmed regularly through the summer. Gardeners, however, find enough to be busy, without being too particular with garden walks. Those requiring an edging that will require little or no attention during the summer, will find a row of parsley, if sown early in spring along the edge of walk, very satisfactory. Sow thinly and have plants thinned to three inches apart it will do much better and

have fine large leaves; it makes a fine edging, is pretty, appropriate, useful and cheap. We had such an edging once on a walk 200 feet long; one side was sown with the curled parsley, the other side with the fern-leaved, and proved very effective, and was admired by many. Thyme will also make a very pretty edging if replanted yearly; if cut back once or twice during the season, it will look much better. W. M. EDWARDS, Conn.

### Storing Cauliflower.

If you have in the field any cauliflower that is commencing to form, pull up and trench in a cold frame and cover the sash with shutters or litter to protect from frost and sun, and you will have nice heads for Christmas. N. BUTTERBACH.

### Keeping Cabbage for Winter.

In your issue of October 30, page 747, Mr. W. M. Edwards gives a hint on keeping cabbages through winter by placing them head down.

The best way to keep cabbage during winter is by pulling up same and putting in trenches, head up, covering with soil until the head is invisible. When heavy frost comes, cover with litter of any kind to prevent the soil from freezing, and to enable the cabbage to be easily taken out when needed. In this way cabbage can be kept until late in the spring. N. BUTTERBACH.

### Effect of Nitrate of Soda.

Some time ago an article appeared in your valued paper, recommending the use of nitrate of soda as a stimulant in the culture of Chrysanthemums, recommending it after the buds had set, thus forcing the time of flowering two weeks ahead. In an article in your issue of October 23, it is said: Nitrate of soda (page 728) will cause vigorous growth of the foliage part of plants and delay the production of flowers and fruit. This would be contradictory to previous statement. Kindly explain how I am to understand this?

I wanted to use the nitrate of soda to bring my out-of-door Chrysanthemums earlier into flower. E. E. S., N. J.

[We certainly have no recollection of having credited nitrate of soda with inducing early flowering. It is indeed contrary to all our observation and belief. Can our correspondent refer to the issue and page?—Ed].

### A New Hotbed Mat.

References have been made recently in these columns to several styles of hotbed mats. In the accompanying illustration, Fig. 217, we call attention to the Palmer mat made of burlap interlined with wool. The ease of handling is a feature of this mat, which we have seen used with great success; it is light, frost

FIG. 217.—PALMER'S HOTBED MAT.

proof, and very easily dried when at all damp, does not harbor mice or vermin, and is made in 3 ft. or 6 ft. width and of any length desired.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

## Diseases of Shade and Ornamental Trees.\*

By B. T. GALLOWAY AND ALBERT F. WOODS.  
(Concluded from page 760.)

### MISCELLANEOUS FUNGOUS PARASITES OF THE STEMS AND BRANCHES.

The fungi described under the previous heads have for the most part prominent fruit forms. There is another group much less conspicuous, but which sometimes causes considerable injury. This group—the so-called black fungi (*Pyrenomyces*)—usually appear as dark-colored pustules on the bark of the stems and branches. The injuries in most cases are local, but in many instances a stem or branch may be completely girdled, and of course serious results will then follow. One of the common members of the group is *Nectria cinnabarina*. It occurs on nearly all kinds of deciduous trees, attacking dead and wounded branches and occasionally wounded roots.

The fungus cannot kill the living cambium and cortex, but grows rapidly through the wood, causing it to turn black and die, while the cambium and cortex are still sound. The wood in this condition, however, is unable to conduct water, so that the parts dependent on it dry up and die.

Another species, *Nectria ditissima*, with bright red fruiting warts, also attacks a great variety of deciduous plants. It spreads very slowly, however (not more than one or two inches in a year). The invaded tissue rots, but the surrounding healthy parts increase in growth, so that the part of the branch around the wound may become greatly distorted and swollen, producing what is ordinarily known as a canker spot. *Nectria cucurbitaria* causes a similar canker disease of conifers, especially the Spruce.

Various other canker-producing fungi attack trees, but it is not necessary to enter into detailed descriptions of them here.

Another class of fungi, belonging to the group of rusts, frequently cause considerable injury to trees, especially conifers. The *Peridermiums* are probably the most destructive of these parasites, attacking stems, branches, and leaves, and causing various knots, swellings, and blister-like patches.

**Treatment.**—From the nature of the fungi just considered, it will be seen that about the only means of checking them is to cut out and destroy the diseased parts as soon as possible. In many cases the injuries to trunks and branches are of such a nature that the diseased parts can be removed without trouble. This should be done, and all wounds thus made should be carefully covered with tar or grafting wax.

### FUNGUS DISEASES OF THE LEAVES.

In common with other plants, the leaves of shade and ornamental trees are subject to the attacks of many forms of fungi. Some of these produce local injuries, while others so affect the leaves as to cause them to fall prematurely. In all cases where the leaves are affected it will be seen that the more they are injured the more serious the results to the tree as a whole, for the leaves are the laboratories in which the food is prepared, and any check or injury to them results in a check to the growth of the tree. Probably the most common fungous parasites of the foliage of trees are those producing various kinds of spot diseases. Maples, Chestnuts, Oaks, Basswoods, Sycamores, Poplars, and various other trees are more or less subject to the maladies in question. These spots are produced by certain species of fungi, which attack the tissues, and by their action first weaken and then destroy them. The spots vary in color, size, and shape, and can usually be distinguished from those brought on by sun scald and similar agencies only by microscopic studies.

Of the other diseases of the foliage, the powdery mildews and rusts are probably the most common. The former attack

many trees and shrubs, producing a whitish, spider-web-like growth on the surface. A common example of this group of fungi is found in the mildew which occurs in late summer on the Lilac. Maple leaves are also frequently attacked, and the same is true of the Chestnut, Willow, and other trees. The rusts are limited to a comparatively few groups of trees, among which may be mentioned the Pines, Poplars, and Willows.

**Treatment.**—There is comparatively little that can be done towards checking these diseases. Spraying in many cases is not practicable on account of the size of the trees, and even if it were, it is questionable whether the injury resulting from the parasites is sufficient, except in some few cases, to pay for the trouble involved. As many of the fungi pass the winter either in or on the old leaves, burning these in the autumn may help materially in keeping the parasites in check. Careful attention to the needs of the trees in the matter of food and water will also go far toward freeing them from the attacks of such enemies as have been described.

## Our Book Shelf.

**The Water Garden**, by WILLIAM TRICKER. Cloth boards, large 8vo., pp. 120; profusely illustrated; price \$2.00. (New York: A. T. De La Mare Ptg & Pub. Co. Ltd.)

To use a hackneyed but expressive phrase, a long-felt want is filled by the appearance of this volume. The growing interest in the culture of aquatics as a leading branch of garden craft is a comparatively modern development, but it is one to be encouraged not only for public parks and city squares, but also on behalf of the suburban resident. It is really surprising what facilities almost any place offers for the establishment of a water garden of some sort, if only half a barrel, and the book before us differs somewhat from the generality of the production of specialists in that, while the largest scope of the subject is masterfully handled the smaller interests are not ignored, and the excellent illustrations of garden views show not only what exists in our parks but go also into private grounds and into the back yards.

Mr. Tricker is qualified to preach if a life devotion to his hobby can qualify any man, and having worked his way from the beginnings to the front rank in this branch of horticulture, the author tells others, from experience, how to get the best results without the preliminary failures. It is a strictly practical book but gotten up in a fine style, with tone plates of select *Nymphaeas* and eighteen full page water views from gardens in existence for the purpose of illustrating, not so much what might be done, but what is now accomplished.

The chapter on treatment of banks and margins is not by any means the least important in the book, artistic treatment of the surroundings of a pond or lake is far more important than the planting of the water plants themselves, and the list of selected trees, shrubs, ferns, etc., should prove most useful to intending planters. Lists of aquatics and sub-aquatics for various purposes occupy several chapters, and the descriptive catalogue of *Nymphaeas* with comments upon their requirements and adaptabilities contains hints of great value. *The Water Garden* is not only a guide but its general appearance is such as to make it a handsome volume for the table.

I receive the *AMERICAN GARDENING* regularly every week, sit down and read it through at once, then mark the different items I wish to read over again, and after I get through with those I do not want, I mail them to different people I know throughout the country. I consider it an A1 paper in every respect, and it should have a very large circulation.—ANDREW PECK.

## Raspberries in the South.

What! Raspberries in the South! some reader exclaims, Why I always supposed that they were not adapted to the South, or that the South was not adapted to them. The foregoing I find is quite a common expression among people from the North, especially New Englanders, when told that raspberries will grow here just as well, if not better, than at the North.

I admit there are some parts of the South, the far South, where the country is level and very sandy, and therefore hotter, in which raspberries do not do so well, but even there they will grow and do moderately well, results depending a good deal of course on the situation and attention given, the plants requiring some protection from the June sun, while the berries are ripening. That is all there is to it; the vines grow luxuriantly everywhere when set out properly and given a little attention.

My honest opinion is that there is no section of the United States better adapted to the raspberry and other small fruits than this mountainous or extensive hill region of the South, commonly called the "Piedmont Belt," unless it may possibly be some of the Pacific Coast states, but that I very much doubt.

Up in this great hill region our summer months are far more pleasant and agreeable than most Northerners suppose. I find there is much misconception throughout the North concerning our Southern climate. It is difficult to make some people believe that their Northern summers, although not nearly so long, are often much hotter than ours. The thermometer here rarely ever goes above 90 degrees, and indeed does not often reach that point, while on the other hand, it rarely ever gets down to 10 degrees above zero. So my readers can readily see that, under such conditions and even with a moderately fair soil, the raspberry ought to do remarkably well, as indeed it does.

I have lived here most of my life, which covers about 20 years' residence, and have had considerable experience, besides study of fruits and berries, especially the raspberry, and I find that with a little attention as to mulching, pruning, etc., they can easily be made to pay from \$500 to \$600 per acre above all expenses, and considering the cheapness of lands in most parts of the country at the present time, I know of no more profitable or better paying business than that of growing small fruits.

The acreage of peaches, grapes, and strawberries is fast being enlarged each year, and now some one needs to take hold of the raspberry in earnest and keep this valuable berry up with the procession.

My method of cultivation is very simple and probably is much the same as that in vogue at the North. I propagate entirely by suckers, as they grow off more readily and will bear a small crop the first season much larger than from cuttings. I take them from the old patch where I have let grow the best ones the preceding summer, and set them out either in November or February, or at most any convenient time during the winter; November being the best time, as the plants become better settled in their places and generally start off a little earlier in the spring. I make my rows about five feet apart and set the canes three or four feet in the row, leaving them from two to three feet high.

Unless fairly clean, the ground to be planted should first be plowed or "turned," as we usually term it, then rolled or harrowed fine, rows marked off and canes set out. Then give an application of stable manure well mixed with straw or leaves, all being well-rotted. Kainit or potash salts of some kind and acid phosphate are also valuable fertilizers for the raspberry. I always apply broadcast after canes are set, and then cover with a mulch. Cotton seed hulls make the best mulch in the world, besides acting as a splendid fertilizer; they are also very cheap, selling now at about 20 cents per 100 pounds.

I don't often give support to the cause

\*In Yearbook of the U. S. Department of Agriculture 1896.

the first season; after that I drive posts about every 20 feet in the row and nail two crosspieces about two feet in length to each post, the first being two feet above the ground, and the next about 18 inches higher, and lacking about a foot of coming to the top of the post. In each end of these crosspieces notches are cut, in which wire is run, on both sides, the whole length of the row. This gives excellent support to the canes and leaves plenty of room for cultivation and the gathering of berries. I have an old patch that I grew in checks or hills about five by five feet each way and gave but very little support, and they did remarkably well. This patch is three years old and last summer I gathered 15 gallons of the finest berries I ever saw, of the Cuthbert variety, from a square about 30x30 feet, and sold them at 15 cents per quart, making \$9 from the square. Think how many such squares it would take to make an acre, and you may get some idea of the profits to be derived.

The Cuthbert is my favorite, and seems best adapted to our soil and climate, although all varieties do exceedingly well. I give all varieties the same treatment, except a little difference as to pruning.

Our markets and shipping facilities are about as good as can be found anywhere. I am within 20 miles of Atlanta (the capital), a splendid city and good market. Population about 80,000. Savannah, Charleston, Jacksonville, and some other Southern cities as well as Northern afford excellent markets. But the majority of our farmers and land owners have very little foresight, and are generally behind the times, not being very quick to grasp new ideas or catch on to a good thing, therefore very little has been accomplished as yet in the way of small fruits, although prospects are bright for the near future.

COY E. CHAMBERLAIN, Ga.

## New Plant.

CYPRIPEDIUM EDWIN LONSDALE, *New Hybrid*. (*Rothschildianum* ♀ × *barbatum* superbum. ♂)

Foliage thick, smooth, vivid green, with an overlay of deeper green reticulations; habit spreading, as in the seed-bearing parent; peduncle thick, twin flowered, hirsute, purple in color, with the characteristic bract so conspicuous in *Rothschildianum*, but less marked; petals spreading, broad,  $\frac{1}{4}$  inch wide by 4 inches long, greenish yellow in color for two-thirds of its length, the remaining third a very pleasing purple, which hue spreads in a pleasing manner through the very strong nerves to the base, two-thirds of the length are beautifully spotted with crimson-purple, while each margin is covered with very long black hairs; dorsal sepal whitish green, overlaid with a very delicate suffusion of rosy crimson, surmounted by 16 or 18 well-defined lines of blackish purple; lateral sepal pale greenish white, slightly rosy, with heavy green bars; lip long, narrow, partaking much of the character of *Rothschildianum*, dull purple, with nervations of darker color; staminode long, greenish purple, entirely overlaid with velvet-like pubescence.

This, taken altogether, is a very pretty hybrid, and certainly worthy a place in a select list. I have named it with the kind permission of Mr. Roebling, (in whose fine collection it is now flowering) in honor of Mr. Edwin Lonsdale, of Philadelphia, who well deserves the compliment, both for his keen love of Orchids and for his high qualities as a successful horticulturist.

HENRY T. CLINKABERRY.

### Southern States Farm Magazine.

With the November number the Southern States Magazine of Baltimore, comes out as the Southern States Farm Magazine. The work of the magazine for several years has been to influence agricultural immigration to the South.

**Horticultural Books.**—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send so. stamp for our new catalogue.

## Terracing a High Bank.

A high bank frequently presents itself and calls for some kind of treatment that shall bring it into harmony with its surroundings. Now a great many people make use of a double terrace in a case like this. To the writer's eye a double terrace is an abomination in the sight of good landscape gardening. Such work looks too much like the base of a monument to be suitable for the lawn. Two terraces may, of course, be used where a broad sweep of sward can slope between them, but, as a rule, they are to be avoided.

At a is shown a high terrace with the usual level top. Instead of making a high terrace to meet the fall of a high bank, it is better to adopt the form shown at b. This gently-sloping top gives a lower and much more attractive sideslope, and is preferable to the former. Fig. c is a plan, however, that may often be used to better advantage than either of the other forms. This gently rounding form for ground that falls

FIG. 218. — STYLES OF TERRACING A BANK.

away suddenly is exceedingly attractive, especially if shrubs are planted upon the curving surface. Many make the mistake of a low set terrace of the angular pattern, when this gentle curving of the turf would be far more attractive. W. D.

### Short Answers.

(To A. C.)—Diseased material should be sent in a fresh condition, not all dried up as yours was. Also for naming a plant more than a single leaf is wanted.

(To E. M. K.)—You could get only a small plant of *Araucaria excelsa* for 60c., it would not be a well-furnished one either.

(To J. Smith, N. Y.)—The leaf sent is probably from *Sansevieria zeylanica*. The plant requires more heat than it has had.

(To Morristown, N. J.)—Gregory's book on Fertilizers may give the information needed. Manures are also treated upon largely in Green's Vegetable Gardening.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

## The Fru Garden.

### Pears in Season.

The varieties of pears on hand at this season are limited when only an ordinary fruit room is to be had. These will consist of Seckel and Sheldon remnants.

The best flavored pear just now is Dana's Hovey, and it is a question to decide whether it is the equal of Seckel or not. But it may safely be said, it is one of the very best flavored pears we have; small, of course, and of no particular beauty, but a taste of a good sample of it only calls forth regrets for its lack of size. The tree is a vigorous grower with thick glossy leaves, needing some training to keep it within bounds in its young days.

Lawrence is a smooth fleshed pear of fine quality coming in just after Hovey; P. Barry is going to be a fine pear for winter, and will take the place of winter Nellis which does not ripen up first-rate with me.

### Look Over Stored Apples.

Apples housed in open barrels or on shelves will require some attention on wet days, but it is not every man that can be trusted with that work. In fact, it is one of the jobs you feel like undertaking yourself if the time needed was at your disposal.

### Fall Pruning of Fruit Trees.

The pruning of the trees can be commenced as soon as the leaves are all off. This should not partake of the wholesale cutting style (to let in the sun), but a general overlooking for any crowding branch and any sappy growths from the center of the trees, planning to let light, not sunshine, into every part of the trees. It should not be necessary to use a saw other than to remove dead branches.

### Inducing Fruiting.

"Many spoll trees in the first ten years by good feeding and the annual pruning of the top to counteract the effect of it, whereas if the top had been practically let alone in winter, and the roots cut back in early March, flower buds and a crop or two of fruit would soon reduce the exuberance of youth and good feeding ground and put the trees on a solid paying basis.

JAMES HOLLOWAY, N. Y.

### Cause of Imperfect Apples.

On page 763 Mr. E. A. Shaw presents an inquiry regarding the fruit of an apple tree in his garden. There is no reason to suppose that the iron rod would cause any such trouble. Probably the trouble is caused by the presence of an insect or fungus, but just what cannot be determined without examining the fruit. Mr. Shaw should submit specimens of the fruit to the Agricultural Experiment Station of his state or the editor of this paper.—W. E. BRITTON, Conn.

The King of Tompkins Co. apple tree is of the Spitzenberg family, and in many situations are really short-lived trees. The iron rod does not cause the trouble. There is a lack of something in your soil the tree wants, which could only be answered by analysis. There may be the apple borer to blame.—C. D. ZIMMERMAN, N. Y.

### Everbearing Peach.

I notice that Berckmans, of Augusta, Ga., catalogues this season a perpetual or continuous bearing peach, the Everbearing, as recently noted in AMERICAN GARDENING. I wish to state that I have known for years of a peach grown in a section of this county that bears two distinct crops; one early and one late. The peaches grow alternately on the twigs, and can be reproduced by buds or grafts. I have seen twigs with fruits the size of a hen's egg, and others the size of a peach pit or stone.—ANDREW C. TODD, Anderson Co., S. C.

We solicit from our readers notes of experience and observation. While our space is limited we will always manage to make room for any communication that contains germs of real, practical value to fellow-subscribers.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 12, 1894.

PUBLISHED BY

A. T. DELAMARE Ptg. & Pub. Co. Ltd.

ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.

Telephone, 3154 Cortlandt. P. O. Box 1897.

REGISTERED CABLE ADDRESS

Commercial Cable) Florez, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1897, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 35 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

## The Henry Strawberry.

Arrangements have been made whereby a bountiful supply of these plants will be ready for spring delivery to subscribers and agents, and in this connection we beg to call the attention of our readers to our generous offer of these plants in another column. We do not think that a more liberal offer has ever been made than the one now advertised, whereby the agent or worker sending us in a club of ten new names, at \$1 each, becomes entitled to 100 Henry Strawberry plants, while five plants will be sent postpaid to each person in his club. This offer will not apply to a club of less than ten. It may be a very long time before such an offer of such a plant can be made again. The wonderful success which has accompanied our premium offer this fall, in the short time at our disposal to advertise it, leads us to believe that the orders for the Henry Strawberry next spring may exceed all anticipations; however, we have planned for a large supply for delivery and trust to be able to meet all demands upon us. Mr. Jerolaman's series of articles is now being placed in pamphlet form, and copies will be mailed free to all who desire to use same in the canvas for new subscriptions.

All the premium Henry Strawberry plants due to date, have been shipped, except where a request has been made to hold them till spring, and judging by the unsolicited acknowledgments received, they are giving immense satisfaction. In order to reduce weight and hinder excessive transpiration some of the leaves are cut off before shipping, this is especially beneficial during a hot spell, and readers can rest assured all is done for the best.

**The Readers and Ourselves.** AS the number of subscribers grows bigger so are we enabled to materially improve the attractions of AMERICAN GARDENING, and it is therefore of interest to present readers to know that the increase in our subscription list since the fall set in places us in such a position that we are enabled to make some announcements as to improvements in and additions to the present features of the paper.

Our readers will greet with pleasure the following statements and we trust they will also cause a redoubling of efforts to gain still more subscribers, in order to help promote a still further liberal and progressive program in the conducting of a paper which all now recognize as the leader in American horticultural journalism. The larger circle of readers the better can a paper fulfill the wants of the individual, and be it well understood, an augmentation of circulation comes in the case of a periodical like AMERICAN GARDENING, best and quickest from within—that is from recommendation by regular readers to those who know not of it.

As a preliminary, therefore, to our announcement, we take the liberty of asking each and every present subscriber, interested in the cause of horticulture, to make it a sworn duty to send in at least one new subscription before the end of this year, and take advantage of the premium offers, so doing he will have a great satisfaction at heart, for what is nobler, or will more readily bring about happiness, peace, and contentment than the possession of a good garden, captivating home surroundings, and the ability to grow plants to a perfection which none can exceed, and this is the information AMERICAN GARDENING seeks to dispense, the knowledge it strives to impart, and who shall say its work has been in vain? Let all know the nature and value of the paper; we will take care of the rest.

Among other attractive new features for the immediate future we announce:

Once each Month a Competition on a subject of general interest, and for which suitable money prizes will be awarded.

Once each Month a Literary Supplement containing full reports of the more important essays and lectures; the special lengthy treatment of some problem; articles of more permanent and scientific interest, etc.

Once each Month a colored presentation plate, suitable for framing. The twelve sheets which will be given away each year forming a collection which our readers will thoroughly appreciate.

A standing offer of a cash prize for a photograph of a well-grown specimen (flower, fruit, vegetable, or plant) with description as to how the result depicted was attained, from start to finish. Cash prizes will also be paid for photographs illustrating general views, such as groups, landscapes, views, garden scenes, etc.; explanatory matter to accompany all photographs.

A column each week devoted to Poultry will be conducted by an acknowledged and well known expert. This should be pleasant news to the many thousands of readers who devote a portion of their time to the poultry yard and moreover

the weekly advent of advice and suggestions should be of much value.

The Apiary will be well taken care of, also by an expert. Beekeeping is one of the most profitable of industries, and a legitimate adjunct of gardening.

From the foregoing outline it will be seen that nearly every weekly issue of AMERICAN GARDENING in the year 1898 will have its own personality or special attraction, and to which it is hoped readers will look forward with pleasurable anticipation. So far then for the general scheme of which the details will be announced later. Watch for them!

But the march of improvement will not cease with what is included in the above enumeration. The style of the paper will be amended, so as to give it a bright and more attractive appearance, and make it an easy matter for anyone to find the information sought.

As in the past there will be the same effort to maintain the reliability of the matter presented, and endeavors will be concentrated in the direction of delivering it as free from technicalities as is consistent with thoroughness; giving short, sharp and incisive expression to the best thoughts, rather than lengthy treatises, which, although good, are perhaps difficult of comprehension to very many. It is to this end that the special monthly supplement is devised.

But one word now remains to be added: We have given our part, now it is for the readers to do theirs. The columns of AMERICAN GARDENING are intended for exchange of thought, idea, and experience, and just as each reader enters into this spirit and becomes in fact one of the circle, so does the general and individual interest increase. To say that we heartily welcome notes, observations, and questions, from all is therefore almost superfluous.

## The Question Box.

Do you want to know anything? If so, ask! The Inquiry Department of AMERICAN GARDENING has always been a leading feature of the paper, and we want our readers to make it stronger still. That is easy; simply send in your questions. We print them and invite any reader to answer. But we also do more; we see to it that the questions are brought before capable authorities, and they will also be handled editorially.

This system makes our Question Box an invaluable medium of exchange of thought among horticulturists and as an educational factor its value is immense.

So far as the conducting of a Question Box is concerned everything depends upon the readers. If they do not make the inquiries no one can answer them. The use of our columns for gathering information is absolutely free to all. Try what an inquiry will do for you.

The more the correspondence received for this department of the paper the more will the editor be pleased and he will leave no stone unturned in the endeavor to secure an ample reply to an obscure point.

## Our Strawberry Pamphlet.

Owing to an expressed desire by the writer to thoroughly revise his series of articles on "Big Berries for All," it may be early in December before we will be able to issue the booklet. It will be well worth waiting for, however, as we confidently anticipate that it will prove the best treatise on the subject ever written, and practical to the core.

## THE QUESTION BOX

*He that questioneth much shall learn much*—BACON.

Readers are invited to forward particulars of any difficulty or perplexity that they have encountered. If the question be one of general interest it will be inserted in this column, so that other readers who may have information to impart can assist their brethren by recounting their own experiences. Questions of a purely individual interest will be replied to by the Editor under the head of "Short Answers."

Questions submitted in this department will receive the full attention of the staff of AMERICAN GARDENING and when desirable will be answered editorially.

All communications for insertion should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR of AMERICAN GARDENING, P. O. Box 1897, New York City. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query or answer are sent, each should be on a separate piece of paper.

Answers should always bear the title of the query replied to and the page on which it appeared, and our readers will greatly oblige us by advising, as far as their knowledge and observations permit, the correspondents who seek assistance. Conditions, soils, and means vary so infinitely that several answers to the same question may often be very useful, and those who reply would do well to mention the localities in which their experience is gained.

**Important to Querists.**—Correspondents must look through the whole of the paper to see replies to their queries. Answers cannot always be given the week after the queries are received, but there is as little delay as possible in dealing with them.

**Cash Prizes** will be given for the best set of answers each week. Payment to be made monthly.

### Fertilizers for Strawberries.

Mr. Jerolaman says: Put on two inches of old fine manure one foot each side of rows of newly set strawberry plants. Many growers cannot get such an amount of fine manure as would be required for an acre or more. Will some grower please inform a reader how much, approximately, of good wood ashes and any good phosphate would replace the manure? Will Mr. Jerolaman tell us the most economical way of putting on the manure after plants are set?—M. W. SMITH.

### Fertilizer for Berries.

In what way can I use or combine fine muck, ashes and rotten sawdust, also slacked lime, to the best results, for berries? Good decomposed manure, I would have to haul five miles. Muck at home, sawdust only one and a half miles, and saw mill—outdoor ashes. Soil sandy loam.—J. M. C., Mich.

### Keeping Gladiolus Bulblets.

Will some one please tell me how to keep Gladiolus bulblets, packed in sand, damp or dry or otherwise, also the best way to plant and grow them? I have peeled them but not more than one in ten or twenty grew. A gardener I know who had a good stand of them, said he didn't peel them, but did not tell how he treated them.—H. M. D., Mass.

### Propagating Holt's Sage.

I have some plants of Holt's Mammoth sage and wish to increase my stock next year. They are now in the ground. Will you please tell me particularly how to manage the cuttings? I have tried several times and failed. Shall I leave the plants in the ground, and what care will they need if taken up?—ANNA CRANDON, Ont.

### Early Celery Bolting.

This spring I sowed celery (Paris Golden Self-Blanching) in the hothouse and had fine plants in the last part of April, when I planted them outdoors in rich ground. They did well and by the end of June the celery was ready for use. The worst, however, was most of the plants ran to seed. From the same package I took the seed for late crop and not

one plant has made seed. What is the reason? Are other varieties better for early growing?—A., Mass.

### Plum Burbank.

Two years ago I bought some Burbank plum trees from Berckmans of Georgia. I noticed a few days ago that suckers have come up a few feet from the trees. I want to know if I take these up and set them out will they bear like the trees or will they be worthless. The trees bore fine fruit this year which ripened in June; not an insect nor an unsightly plum on the tree. In the same lot of trees was a peach that bears lovely double flowers, but no fruit; it is a fine, shapely tree fully 12 feet high, but as flowers only last a short time and I have little ground to spare, I will dispose of it if it bear no fruit. This tree must have been sent in mistake, for I did not order it.—MARGARET E. CAMPBELL, Louisiana.

### How to Flower Echinocactus.

I have an Echinocactus that I brought from southern California four years ago. It has grown well (in the greenhouse), and yet it has not blossomed. Can you tell me of anything I can do to make it blossom? Do they have to be larger and older? The brethren grow to the height of four and even five feet, and perhaps this must be larger. I should like to know.—KATE FOOTE COE, Conn.

### Perforated Tile for Greenhouse.

I should be glad to have an address where I could get perforated tiles for greenhouse benches.—G. M. STRATTON.

### Wintering Berry Seedlings.

I have a fine lot of strawberry seedlings from Brandywine and Marshall. I raised them in boxes about 16x20 inches, 5 inches in depth. Please tell me the best and safest method of carrying them through the winter.

Will they live through if I put the boxes on the ground side by side and cover with a light covering of corn-stalks? The plants have three to five leaves and some have commenced to make runners.—J. J. SEELYE, N. Y.

### Propagating Small Fruits.

How can I best increase blackberry, raspberry, and currant plants?—E. F. L., Va.

### Peppermint as a Crop.

Please give me general instructions for culture of peppermint for commercial purposes, viz., soil, distance apart to plant, cultivation, harvesting of crop, etc. What is the average crop per acre? What is the market value of same? Is there any book published that gives information on this question?—JOSEPH WOOD, Pa.

### Jasmine Not Growing.

I obtained a *Jasminum gracillimum* in the spring, and planted it in a mixture of loam, old manure and sand. Sometimes it has thrown out shoots from the axils of the leaves and would seem to grow a little, but most of the time it has stood still. It has had full sun; the leaves are a yellowish-green color and were so when it came.

Is there anything I should do with it or is it all right? I expected it to bloom this fall.—A. CRANDON, Ont.

### My Pinks Don't Flower.

How many branches ought there to be left on a Pink to do well? My Pinks are full of buds large and full, but they do not open. What is the cause of their not opening?—J. L. B., Mass.

### Lavender for Market.

Will some one kindly explain in your paper the most approved method of cultivating Lavender and preparing it for market, and greatly oblige?—R. H. C., Conn.

### Chrysanthemums Not True to Color.

Can any reader give me the reason for two varieties of pink Chrysanthemums coming white this season? I have grown

Geo. A. Magee and Vivland-Morel cuttings from last year's plants, and both varieties have come white. They had the same treatment as all other varieties, such as Ada Prass, Helen Bloodgood and Lillian B. Bird, all of which came their true color.—G. R. C., Toronto.

### Dwarf Apples.

How are dwarf apple trees grown? Are they root grafted or budded? What kind of stock is used?—L. J. F.

### Greenhouse Heating.

I am building a forcing house to the south and against my residence, 20x32 feet and about 7 feet high. I have an upright single flue boiler 2½x6 feet, with a firebox 25x32 inches.

I have cut two holes for 2-inch pipes in the top, and two near the bottom. I intend to place the boiler in cellar of residence and run one 2-inch pipe through cellar wall into forcing house and to the south end (hanging from ridge pole), and then down, being split to two 1½-inch pipes at south end of house, then going around house and back to bottom of boiler. The other pipe to go up into house through radiator and back to bottom of boiler. Shall have a stand-pipe to attic to a 65-gallon tank which will be connected to one of the return pipes just before it goes into the boiler; that tank to be kept about one-half full of water to insure the boiler and all pipes being filled.

(1). Is the above correct and will the water circulate with the supply on the return pipe, or would it be better to go direct into top of boiler. I have an extra opening for 1½-inch pipe on top that I will not use.

(2). How much pipe or how many square feet of heating surface to a given amount of space for forcing house and residence?

R. SINCLAIR, Ohio.

I am looking for advice about my greenhouse. No. 1 is 60 feet long, 19 wide, and 18 from floor to ridge; it is divided into three compartments, each compartment is 20x19. A will be used for Ferns, Crotons, Fuschias, and other shade and moisture-loving plants. B, for Palms and other plants requiring a high temperature of 60 to 75 degrees. The tables will be made water-tight, so I can sub-irrigate (as all plants will be grown in pots). The glass in this house is 20x15. Ventilation on each side of ridge and side tables.

House No. 2 is 60x21 base x10 from floor to ridge, will be used for Geraniums, Roses, Heliotropes, Bouvardias, shrubbery, and miscellaneous plants, requiring from 40 to 75 degrees. This house is roofed with cold frame sash 3x8, panes are 6x8, ventilators at top, on each side every other sash; roof is supported by iron pipes 1½-inch diameter, with 1½-inch purlin; each ventilator to close against a strip of India rubber fastened to the ridgepiece; walls constructed with cement.

House No. 3, 60x9 base x7 from floor to ridge, I shall use for various purposes as propagating plants, flowers, and vegetables, or growing cucumbers or bedding plants, in fact, it will be used as a hothouse or cold frame for general purposes; the roof is constructed from cold frame sash 3x8, panes 6x8; the tables will be boxed in from floor to surface, to be heated under and above, floor of tables will be laid with perforated tiles. Walls are double boarded, ventilation will be regulated by "New Departure."

The houses run north and south, lowest temperature ever known 15 below freezing.

On the north end is potting shed, gardener's room, etc. I should be glad to know what sized pipes I should use in each house (hot water) where they ought to be placed, how many runs, flows and return for each house (also for gardener's room). Should they be wrought or cast iron? Also size of boiler to circulate the water, sufficient for houses, etc., described with an allowance for one or two more greenhouses 60x21x10 at some future time.

Taft's book contains so much information that I am bewildered.

G. M. S., Fla.

## There is Not a Home in the Land

But calls for a yearly Calendar.

Every family tries to get one or more; generally more.

## There are Calendars and Calendars

Some are good, some bad, most of them indifferent.

## There Will Not be a Calendar Issued for 1898

To exceed in artistic elegance, finish, beauty of designs and effective coloring, the one we to-day offer as a premium to every subscription to AMERICAN GARDENING received before December 31, 1897.

# EVERY SUBSCRIBER IS ENTITLED TO ONE

AND CAN EASILY EARN TWENTY.

OUR magnificent **Rose and Girl 1898** six sheet **Art Calendar**, two months to a sheet, each sheet  $8\frac{1}{2} \times 11\frac{1}{4}$  inches, is superbly lithographed in eleven colors, and printed on hammered paper; the whole tastefully tied with silk bow—undoubtedly a work of art fit for the most elegant home, and as handsome a Calendar as was ever published. Each one of the six designs presents a distinct type of female loveliness and a fresh study in roses, the coloring on each sheet being rendered in harmony with the design. There is not a line of advertising on the Calendars to detract from their value. They will not be sold by us for less than \$1.00 each

### Who is Entitled to a Calendar?

**EVERY SUBSCRIBER** renewing before **December 31, 1897**, enclosing Five Cents additional to pay packing and postage.

**EVERY NEW SUBSCRIPTION**—To induce people to test the value of AMERICAN GARDENING we will send the Calendar absolutely free to every name received direct not previously on our mailing list. Remit \$1.00 for A. G. 12 months.

**EVERY ONE** sending us a club of Four 3-month trial subscriptions at twenty-five cents each, will get a Calendar, free as a premium, by return mail.

**EVERY NEW** name sent in by an agent.

NOTE.—We have ordered manufactured for us a large stock of these superb Calendars in the endeavor to have sufficient supply for all demands, but will not guarantee to fill orders after supply is exhausted. Therefore, order yours now.

**Special to Agents** A copy of our Art Calendar to show people will clinch the argument and obtain the subscription. Bona fide Agents will be mailed one copy, securely wrapped, on receipt of only Twenty-five cents (one-fourth its value.) Armed with this superb Calendar we misjudge human nature greatly if any ordinary mortal cannot secure a big list of new subscriptions every day. Every new subscriber you send us gets a Calendar by return mail.

### We Pay Agents

Every new subscription at \$1.00 entitles the agent to **Five of the Wonderful Henry Strawberry Plants**, to be delivered next Spring. Thus 100 new subscriptions would secure agents 500 plants; a possession worthy of your consideration. Every new subscriber taken by agent will receive one of our Art Calendars free by return mail.

Agents who do not want the Henry Strawberry Plants can retain as their payment **20 cents in cash** on each subscription they take, or will be credited **twenty-five cents** on any book, magazine or publication they wish to obtain through us.

correspondence

**AMERICAN GARDENING, P. O. Box 1697, New York.**

REMIT BY P. O. or EXPRESS MONEY ORDER—IT IS SAFEST.

**The Window Garden.**

**Edgings for Window Shelves.**

The beauty of the window from the inner aspect can be wonderfully enhanced by the free use of trailers along the edges of the shelves. The value of the old Kenilworth Ivy for this use is well known. Among newer things, the pretty gray-green Lotus, known as Coral Gem, makes a very dainty edging. A table of brilliant Geraniums, bordered with the silvery trailing stuff made a very good impression at an exhibition lately seen. More generally satisfactory, perhaps, though not quite so delicate in its beauty, is the new form of Asparagus called Sprenger. This bids fair to be good wherever used, and as it grows well in partial shade, it will not be difficult to find uses innumerable for it.

**Varying Temperatures.**

It is often the too great variation between the day and night temperatures that causes the plants to come to a standstill, or to begin to go backward. And we of this variable climate, though we feel the cold, do not realize the real fall in temperatures during cold spells in late summer and in autumn. A few mornings back the temperature in the house, where night fires had not yet been kept, was found to be but 44 degrees. In the dead of winter, when the temperature touches 40 degrees, we begin to get uneasy lest it go so low as to injure the plants; yet here, in November, the contrast between day and night was almost as sharp, being in the living room about 30 degrees.

**The New Potting Fibre.**

It is queer looking stuff! In appearance it is something like a mixture of pure horse manure, mostly rotted, and leaf mold. Water sinks into it as into a sponge, and is retained to somewhat the same extent. The lightness of the pot betrays at once the fibre-potted plant, without the need of a label. This, alone, would be sufficient reason for its use among women window gardeners. We have a number of things potted in fibre, and are anxious to prove it all that is claimed for it. Certainly, if we have a cleanly, light, easily-obtained potting material which will indeed make plants to grow like magic, all the women who grow plants want to know all about it.

**A Window Cobaea.**

It was fully midsummer when seeds of the newer form of Cobaea, known as C. macrostemma were planted in one of the window pots, just for the sake of filling an empty space temporarily with a bit of vinery. Long ago the vine reached the top of the window. It has not had any care except that of supplying water at the root. Not one drop of water has reached the foliage, at any time, yet the vine is now budding nicely, and bids fair to give bloom in two weeks from the present writing. It is rather delicate as to color, but the foliage is of good size and the buds look healthy.

**Variegations.**

More and more does the fancy for variegation in foliage take hold of the buying public. Yet the buyers of such stuff should be warned that this same variegation is a constant urging to the best culture possible because it is always a sign of lessened vigor, if not of actual disease. It has been said that plants, or rather shoots, entirely white cannot be propagated, and in our own experience we have not been able to disprove the affirmation. Florists are able to make many variegated forms show up in fine, thrifty shape, and outdoor stuff sometimes does well, but indoors, where all the conditions are likely to be more or less unfavorable, there is less likelihood of good success.

**Variegated Abutilons.**

The above does not hinder us from saying that the new silver-edged Abutilon Savitzii is pretty enough to warrant a trial of its resistant characteristics. It can hardly be called on the market until next spring, as stocks have been limited, and prices last spring were so high that few people have tried it. It is more delicate looking than Souv. de Bonn, with

much more of the white. Yet, as one of the most delicate in appearance of the silver-edged Geraniums, Mme. Sallerol, roots with phenomenal ease and often grows with wonderful vigor, so let us hope this new candidate may do. And this hope may be the stronger from the fact that the Abutilons generally are among our most thriving window plants.

MYRA V. NORYS.

**Some Pomological Notes and Corrections.**

My good friend, the editor of AMERICAN GARDENING, in his notes on fruits at the American Institute Fair, on page 714, unwittingly made some mistakes which it might be well to correct. He credits a display of guavas and guava jelly, one of the Pineapple quince, one of the Campbell Early grape, and one of the fruit of the slyphus (jube) along with other fruits, to Mr. P. J. Berckmans, of Georgia. Mr. Berckmans did send a very fine display of Kleffer pears, as the editor truly says, and a number of plates of several named kinds of the Kakio Japanese persimmon, and two kinds of pomegranates. All these were very interesting and creditable. But the guava in all its species and varieties is strictly tropical, and especially the species Psidium guava on the table beside Mr. Berckman's exhibit. This fruit, and the delicious jelly made from the same kind of fruit, came from Mr. L. H. Gurney, of Merritt, Florida. The pungent, and to most people, the pleasant perfume of the plates of yellow, lemon-shaped guavas attracted more curiosity, if not more interest, than any other fruit on the many tables at the fair. As superintendent of the pomological department of the fair, I tried to have many visitors taste as well as smell it, for it is a most enjoyable and wholesome fruit.

Being very delicate in skin, as much so as the tomato, the fruit could not remain long on the table after two days' travel by express, and being little known, it was necessary to use it while it lasted, and get fresh supplies from Florida, to keep up a display for the four weeks of the fair. This was done, much to the pleasure of those who tasted the fruit, and the jelly also.

The guava is to the people in tropical Florida what the peach is to the Northerners. It somewhat resembles in taste the strawberry, and served with cream and sugar I have never eaten any more delicious fruit. Guava jelly is generally considered the most delicious of all preserves, and sells at a high price.

The Pineapple quinces were sent by Luther Burbank, of Santa Rosa, California, and this is the first time this variety has ever been shown to the public. It is a large and most excellent variety, being considered by Mr. Burbank, so he writes me, the best of all the kinds he has originated. I ate one just as an apple.

The display of Campbell Early grape was from the introducer, Geo. L. Joselyn, of Fredonia, N. Y., and was a most attractive show of that valuable new variety.

The plate of jube fruits was from Dr. C. D. Coleman, of Augusta, Georgia, one of Mr. Berckmans' neighbors. It may not be known to many that the tree producing this fruit is hardy in the Gulf States. It is a deciduous tree, and resembles the Locust family in style and foliage. The fruit is about the size and shape of ripe dates, and has a thin skin, enclosing a pleasant, tartish pulp, in which is a stone like that of a plum. What is known in confectionery as jube paste is made from this pulp, and is relished by many city children.

H. E. VAN DEMAN.

[We regret that the wording and punctuation of our report should not have been plain enough for Mr. Van Deman. There was no intention of attributing all the objects named to one exhibitor.—Ed.]

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere

**PEACH TREES, \$3 PER 100.**

## PRIVATE GARDENERS.

### Appointments and Doings.

Gardeners and others knowing of recent appointments and movements are requested to forward particulars of the same for publication in this column. No charge is made.

### Newport, R. I.

Mr. Thomas J. Gibson has been elected to the City Council. Mr. Gibson is the senior member of the florist firm of Gibson Bros. Andrew K. McMahon, ex-president of the Horticultural Society and president of the Florists and Gardeners' Club during its short life, has been elevated from the Common Council to the Board of Aldermen; and Frederick Bradley, the present president of the Newport Horticultural Society, has been elected to a place on the School Committee.

### Chrysanthemum Society of America.

**Seedlings.**—The committees judging new seedlings will be in session this and every Saturday up to and including November 27.

Exhibitors should make their entries (a fee of \$2 is charged for each variety exhibited) to the secretary, not later than Tuesday of the week in which the blooms are to be shown.

Blooms may be sent to any of the following addresses, express prepaid:

Boston.—A. H. Fewkes, Horticultural Hall.

New York.—Eugene Dalledouze, care of New York Cut Flower Co., 121 W. 23d Street.

Philadelphia.—Edwin Lonsdale, 1514 Chestnut street.

Cincinnati.—B. Witterstaetter, corner Fourth and Walnut streets.

Chicago.—W. N. Rudd, room 202, 185 Dearborn street.

### Secretary's Official Report.

Seedling chrysanthemums submitted to the committees October 30, '97, are as follows:

#### NEW YORK.

**Matterhorn**, Exhibited by Peter Henderson & Co., New York. Japanese reflexed, white; scored, exhibition scale, 75 points.

**Klondike**, Exhibited by Peter Henderson & Co., New York. Japanese reflexed, rich yellow; scored, exhibition scale, 68 points.

**Mrs. O. F. Diehm**, Exhibited by Peter Henderson & Co., New York. Japanese incurved, white, with lilac-pink suffusion and marking; scored, exhibition scale, 56 points.

**Florence Turner**, Exhibited by Peter Henderson & Co., New York. Japanese incurved, amber; scored, exhibition scale, 55 points.

**Mrs. Wm. Maasie**, Exhibited by Peter Henderson & Co., New York. Japanese incurved, rosy pink; scored, commercial scale, 81; exhibition scale, 80 points.

**J. R. McDonald**, Exhibited by John Marshall, Purchase, N. Y., incurved canary-yellow; scored, commercial scale, 81 points.

**Sea Foam**, Exhibited by D. Wm. Brainard, Thompsonville, Conn., Japanese reflexed, cream; scored, exhibition scale, 81 points.

**Col. D. Appleton**, Exhibited by J. R. McDonald, Riverdale, N. Y., Japanese incurved, yellow; scored, commercial scale, 66 points.

No blooms were submitted at Chicago and Cincinnati. Philadelphia sent no report.

ELMER D. SMITH, Secretary.

### Boston Flower Show.

The show was an excellent one and worthy of New England and its chief horticultural society, but it can hardly be claimed, as a whole, to have excelled its immediate predecessor of 1896, and in the opinion of some experts, the exhibitions of the past two or three years would make a more than favorable comparison with that of the present week.

The show was held a week earlier than last year, and the fact that two of the principal exhibitors of past years, James Brydon (cut blooms) and T. D. Hatfield

(plants and blooms) were not competitors this year may in part account for the evident standstill which has been reached. On the other hand there were several new exhibitors who made entries of very high quality, among them being A. Herrington, Madison, N. J., gardener to H. McKay Twombly, Esq., and Robert Laurie, Newport, R. I., gardener to Cornelius Vanderbilt, Esq., while Alex. McKay, gardener to David Nevins, Esq., Mr. Charles H. Souther (C. Sandford, gardener), and E. M. Wood & Co. competed with their superb products in many more classes than heretofore.

The chief exhibitors of specimen plants were William J. Martin, gardener to N. T. Kidder, Esq.; John Barr, gardener to Mrs. B. P. Cheney, and William Donald, gardener to Jason S. Bailey, Esq., among whom the prizes in the various classes were all distributed. In the classes calling for plants grown to stem and bloom, the honors were divided between Mrs. A. W. Blake, George B. Green, gardener to James L. Little; Dr. F. Roy, gardener to Hon. E. S. Converse; Kenneth Finlayson, gardener to Dr. C. G. Weld, and C. Sandford, gardener to C. H. Souther, Esq.

The prizes for groups of Chrysanthemums arranged for effect, limited to 100 square feet and edged with ferns or low-growing decorative plants, were competed for by Messrs. A. W. Blake, Dr. C. G. Weld, John L. Gardner (William Thatcher, gardener), J. W. Howard, and E. S. Converse, and awarded in the above order.

The competition on the cut blooms was perhaps as close as ever before, and the quality of exhibits was very high. There were absolutely no inferior blooms in the hall; in fact, for several years flowered other than of the first grade have been seldom seen at these exhibitions. E. M. Wood & Co., Joseph H. White, Esq. (James Wheeler, gardener), C. H. Souther, Esq., David Nevins, Esq. (Alex. McKay, gardener), N. T. Kidder, Esq., Mrs. B. P. Cheney, James L. Little, Esq., Hon. E. S. Converse, J. W. Howard, Esq., Dr. C. G. Weld, Cornelius Vanderbilt, Esq., H. McKay Twombly, Esq., Hon. John Simpkins (John Jaffray, gardener), Mrs. E. J. Clarke (John Ash, gardener), and W. S. Craig, were the principal contributors, and all may well feel proud of their share in getting together such a magnificent collection of superior specimens.

Hugh Graham's new Chrysanthemum Pennsylvania attracted much attention and was awarded a first-class certificate of merit, and the vase of Frank Hardy, which received first prize for best vase of ten blooms, white, exhibited by Mr. Herrington, was especially admired.

Other features of the show were fine collections of Carnations from Peter Fisher and William Nicholson. Mr. Fisher received first-class certificate of merit for Carnation Mrs. Thos. W. Lawson, which he exhibited last year as No. 999. A. Roper received honorable mention for new Carnation, Mayor Quincy, and Joseph Hilbert, Nyack, N. Y., the same award for sport of Swainsona. J. J. Van Alen, Newport, R. I. (Arthur Griffin, gardener) received a silver medal for hybrid Begonia semperflorens. James Comley and Mrs. E. M. Gill made good displays of cut flowers. W. P. Winsor showed fine Cyrtipedium insignis; F. E. Palmer, a fine plant of Nephrolepis exaltata; J. S. Bailey, some beautiful Orchids including Miltonia Morellana atro-rubens on which he was awarded first-class certificate of merit.

### Port Chester, N. Y.

The West Chester Co. Gardeners' Association held its first regular exhibition here on November 5-6 in the Opera House. This being the first exhibition of its kind ever held in this town and the Society itself being less than a year old there was considerable speculation as to the possible outcome. Local spirit ran enthusiastic, however, and the Society had the banner show of the season, both for quantity and quality. Competition was close, from eight to fourteen contestants appearing in some classes. Fully 2,000 blooms were in competition. One of the largest contributors to and sup-

orders of the show was Hobart J. Park, and the thanks of horticulturists are due him for his valuable aid.

#### At Blooms.

The best 12 varieties distinct, shown with long stems in single glasses brought together 12 competitors with a fine display of quality. W. Slack, gardener to E. E. Hoyt, Stamford, Conn., securing the prize, with W. Scott, gardener to G. F. Eastman, Tarrytown, a good second, George Winslade, superintendent of the Osborne estate, coming third. The varieties in the winning 12 were: Modesto, G. M. Magee, H. Riegan, Minerva, Florence Laneham, Silver Cloud, Florence Pullman, Biglow, Jennie Falconer, Niveus, Golden Gate, and Mrs. J. Pullman.

The prize for six yellow (nine competing) went to William Anderson, gardener to F. E. Constance, Mamaroneck, with Golden Wedding, Robert Williamson, gardener to Mrs. A. A. Anderson, Greenwich, being second with a fine vase of Modesto.

For the best six white no less than 11 lots competed, the variety Mrs. Robinson securing first and second, the exhibitors being Mr. Winslade and Geo. Draycott, gardener to Wm. H. Parsons.

For the best six pink Mr. Anderson secured first with a remarkably fine lot of Mrs. Perrin; Wm. Harvey, gardener to Hobart J. Park, being second with Erminilda.

For six reds the awards went to Messrs. Winslade and Anderson.

Six "any color" brought out a strong lot. W. Smith, gardener to the Mrs. Mallory estate, was the successful contestant with some fine Modesto, Geo. Draycott being second with well-grown Major Bonaffon. There were four competitors in the class calling for 24 distinct varieties shown singly with long stems. Here again Mr. Slack was first with an even lot well set up. W. Harvey was second, and John Shore, gardener to W. H. Macy, third.

For 12 blooms on boards, seven competing made a fine showing. Mr. Anderson's winning lot being grand, well-finished, in good color and form. His varieties were Mayflower, W. M. Wallace, Jennie Falconer, Iora, Niveus, Mrs. E. G. Hill, Mrs. Robinson, Mrs. Perrin, J. Shrimpton, Modesto, Nemesis, and Mrs. Peabody. Thomas Harvey, gardener to Commodore Smith, Stamford, was second.

Six hirsute varieties were best from A. Grierson, gardener to Hicks-Arnold. A special prize of \$25 was offered for the best 12 yellow, and in a good competition Wm. Harvey, gardener to Hobart J. Park, with 12 well-grown Eugene Dailedouze was first.

In the open class for the best display, Hobart J. Park was first and Paul Burgevine, Portchester, second.

#### Pot Plants.

For the best three trained plants Mr. Winslade was first with Mutual Friend, W. H. Lincoln, and Mrs. Robinson. W. Smith was second with a fine plant of Erminilda nearly nine feet in diameter. Winners in other plant classes were Messrs. Winslade, Cowan, Harvey, and Anderson.

For a group of Chrysanthemum plants covering 150 square feet, Wm. Harvey was first, also for a group covering 100 square feet; for a group of decorative plants and bloom arranged for effect, John Shore was first with a tastily and well-executed arrangement, Gustave Amrhy being second. The last-named secured first for best Palm, showing Zamia horrida [which, however, is not a Palm at all.—Ed.] also best new and rare plant. W. Anderson had fine Ferns. John Shore six highly-colored Crotons, and R. Jenkins, gardener to Mrs. Sackett, Rye, three tubs for Cosmos. The six pots of pompon Chrysanthemums exhibited by Geo. Winslade were the gems of the show. The varieties were: Bob, Snowflake, Early Blush, Rosanthe, Maid of Kent, and Bouquet.

#### Violets and Roses.

These were well represented, the leading prize takers being Charles Wiese, gardener to Mr. Walter Law; J. Logan, gar-

denier to Whitelaw Reid; Martin Glendon, gardener to Charles Mallory, and John Marshall, gardener to Trainor L. Park.

The exhibit of hothouse grapes was superb and as an object lesson of what can be done with late varieties, was of the greatest value. The Gros Colmar from Wm. Anderson were grand, the berries were of great size, fine finish and color, and better still of surprisingly fine flavor. Geo. Winslade and W. Slack were also successful exhibitors in these classes. Martin Glendon staged a fine collection of vegetables; John Shore, fine celery; R. Jenkins, excellent cauliflowers.

Robert Williamson secured the prize for the largest and best bloom in the show with Mrs. H. Weeks, a grand bloom of immense size and character with excellent stem and foliage slightly hirsute, and from the appearance of this one bloom, a dangerous rival to the popular Mrs. H. Robinson.

#### Morristown, N. J. Flower Show.

The second annual exhibition of the Morris County (N. J.) Gardeners' and Florists' Society which was held here on November 8 and 4, was a decided improvement over the display of last year, which means that the quality was of a high order. The hall used this year gave more room and better light to the exhibits and assisted much to the good impression of a first-rate show.

The premier awards in the chrysanthemum classes were secured by Mr. Tilden (gardener M. McNulty), who had nicely finished specimens, very shapely. In the close competition for six white, he had excellent Queen, which stood up well, a feature that was lacking in most of the other entries in this class. In yellow this exhibitor had Bonaffon, and in the class for six varieties, twelve blooms, he led easily. Mr. G. Bird was the next in merit in this section. In the class for six blooms, any other color, Mr. G. E. Kissel (gardener H. L. Hand) won easily with superb specimens of Good Gracious. We do not recall having ever seen better blooms of this variety.

The display of roses was large and competition generally ran very close. E. Brant took a well-merited award for 24 American Beauty, in which he was the only exhibitor. There were five entries for 12 blooms of Beauty, and Mr. Tilden took the premier honors, with Elwood Brant and H. C. Holmes, respectively second and third, there being but little difference in merit.

There were seven entries of Bridesmaid and eight of Bride, for both of which Mr. Brant led in a hard fight, Mr. J. Ryan and Mr. Tilden also making good displays. Mr. Brant also staged in the class for six varieties, having some very fine Meteor.

In violets the display of the Whippany Violet Farm (D. H. Burnet, manager) was the best, and an extra arrangement of violets with smilax in an epergne, by the same, was most attractive; it was awarded a certificate of merit. Messrs. Duckham and Holmes were second and third for doubles, with Mr. Holmes the only exhibitor of singles and whites.

Groups of plants were a feature and

(Continued on next page.)

#### \$100 Reward, \$100.

The readers of this paper will be pleased to learn that there is at least one dreaded disease that science has been able to cure in all its stages and that is Catarrh. Hall's Catarrh Cure is the only positive cure now known to the medical fraternity. Catarrh being a constitutional disease, requires a constitutional treatment. Hall's Catarrh Cure is taken internally, acting directly upon the blood and mucous surfaces of the system, thereby destroying the foundation of the disease, and giving the patient strength by building up the constitution and assisting nature in doing its work. The proprietors have so much faith in its curative powers, that they offer One Hundred Dollars for any case that it fails to cure. Send for list of testimonials.

**DO YOU NEED WATCHING?**

Or, to put it another way,  
**Do You Need a Watch?**  
We sell them, sell them at such an exceedingly low price that you can't afford to go watchless. Got 'em all sizes and styles. But we'll just mention two:  
An Elgin or Waltham Watch, best movement made, hunting case, accurate time-keeper, handsomely engraved, Bueber Case, heavily gold-plated—last for all time. Ladies' or gentleman's size.  
We'll send it to your address with privilege of examination. If it's not entirely as represented, send it back—costs you nothing. If you like it, pay the agent express charges and \$6.00. —That's fair. Or this—  
A Hunting Case Watch—beautifully engraved case, first-class movement, any size, heavily plated (14k)—looks just like a \$40.00 gold watch—keeps as good time as any of them. Sent to your express agent with privilege of examination—same conditions as all our watches sent out—and if you like it, pay him \$6.45 and express charges.  
If you take our word for it, and send money with order, a handsome chain goes with either, and express charges are paid by us, for the prices named above.

**A BARGAIN**  
We have made arrangements to furnish **THE OHIO FARMER** of Cleveland, O., and **AMERICAN GARDENING**, both papers, one year, making a total of 104 great papers, for only **\$1.60**  
**ONLY \$1.60**

**THE OHIO FARMER** is well known as one of the very best, largest, and in every way the most desirable weekly agricultural journal of this country. It is clearly the **LEADER** of the Agricultural Press of America. A 20-page, 80-column paper **EVERY WEEK** in the year; employs **THE VERY BEST WRITERS** that money can produce; a strong, fearless defender of the agricultural interest of this country, and **CLEAN** in both reading and advertising columns. **IT HELPS MAKE THE FARM PAY. SAMPLE COPIES FREE.**  
Present subscribers can order this combination at once and have their present term of subscription to **AMERICAN GARDENING** extended for one year. New subscribers to **THE OHIO FARMER** will receive the rest of this year free. Address all orders,  
**AMERICAN GARDENING, P. O. BOX 1697, NEW YORK.**

**HENS AND EGGS**  
Undoubtedly there are many readers of **AMERICAN GARDENING** who keep hens who do not take a poultry paper; possibly some take the wrong one. Gardening, fruit culture and poultry keeping dovetail together perfectly, each filling a season comparatively dull in the others.

Realizing the above facts, we have arranged with the publishers of **POULTRY MONTHLY**, to offer that journal in club with **AMERICAN GARDENING**, for the coming subscription season, both journals postpaid, one year, for the **SMALL SUM OF \$1.25.**

**POULTRY MONTHLY** Is now in its nineteenth year; it has always been recognized as the leading publication in its particular field. Sound and reliable in its teachings, and not the mouthpiece of cranks, cliques, or rings. Its correspondents are practical and successful men, in the harness to-day. The publishers of **AMERICAN GARDENING** recommend **Poultry Monthly** as being one of the very best poultry papers issued, and advise all interested to accept this Great Combination Offer.

**A WONDERFUL OFFER!**

**American Gardening** (Weekly), \$1.00 } Both \$1.25  
**Poultry Monthly**, " " 1.00 } One Year, postpaid.

Present subscribers who are in arrears must pay up in full to become eligible to this offer.  
Address **AMERICAN GARDENING, P. O. Box 1697, New York City.**

the chief honors in the competition went to Mr. Keiser, of Morris Plains Asylum. His arrangement of foliage plants was very tasteful, and Otaheite oranges were used with much skill to lighten the whole. The arrangement of chrysanthemums and foliage plants from the same exhibitor was also a worthy piece of work and contained some very fine blooms. Mr. Elliott, who was second for group of foliage plants, had a too crowded arrangement.

The non-competitive display of Mr. Duckham, gardener to D. Willis James, Esq., was grand; the chrysanthemums were each high-grade exhibition blooms, and the foliage plants used with consummate skill, were not only in fine condition, but embraced rarities, *Coccos Bonetti* acting as a fine center piece. Mr. Herrington, Florham Farms, Madison, did not compete, but added to the display by a collection of anthuriums, chrysanthemums of much merit, including the single Daisy, and other objects.

There was a small showing of orchids in which Mr. Duckham was placed first, with *Lager & Hurrell*, Summit, N. J. second. Mr. Duckham had the greater number of plants, chiefly *Cattleya labiata*. In the other lot a belated *Cattleya Mendellii* was seen in good form, also *Lelia praestans* and *Oncidium varicosum*.

Some excellent vegetables were shown and in good quantity, the tasteful arrangement of the collections being very pleasing. Mr. James was first here with Mr. McMullen (gdr. for Mrs. Stone), second. Celery was good from Mr. Munroe and apples from Mr. Kiesel.

In conclusion we must compliment the committee on its management; the staging was done to time, the judges got to work at once, and the awards were placarded on the exhibits just as soon as the decision was made—no delay, no hitch—and when the public entered everything was ready for the inspection. What one society can do another can also with the right men and the A. T. De La Mare exhibition stationery.

**Poughkeepsie, N. Y. Flower Show.**

The Dutchess County (N. Y.) Horticultural Society held its annual chrysanthemum show in the Armory, November 3, 4, 5. Taken as a whole, this season's show was fully equal, and in some points superior, to previous ones. Chrysanthemum blooms were more abundant than last year; the general average of the flowers was excellent, many of them being of great size. This was especially noticeable with the varieties *Mrs. Henry Robinson Vivian-Morel*, *Mutual Friend*, and *Mrs. Peabody*.

One great incentive to such a good showing of fine blooms was the number of special awards offered, and it was in such classes that the best kinds were staged.

One of the keenest contests of the day was for the Henderson prize calling for 12 white. I. L. Powell exhibited *Mrs. Robinson*, and A. Herrington, Frank Hardy. The latter were fine and showed up well on their great stems and heavy foliage. On the other hand, Mr. Powell's *Mrs. Robinson* were heavier and more uniform.

Cut blooms on boards is always a feature here, and this season they were more generally used. The Butterfield prize for 24 blooms brought out six exhibitors, and it was in this class that the best flowers were found. Mr. Blair may be rightfully complimented upon his winning 24.

Violets, naturally, are one of the leading features at Poughkeepsie, and this year exhibitors were encouraged by some very liberal special prizes in addition to the Society's cup and awards. But owing to the earliness of the season and the Violet crop being late the display was smaller than heretofore, and there was a slight falling off in quality.

Thomas Emerson, gardener to the estate of W. B. Dinsmore, Esq., made a circular group of Orchids, producing a handsome effect. The centerpiece was a grand plant of *Cattleya Bowringiana*, bearing seven spikes. There were also 12 plants of *C. labiata*, all special types and very fine. *C. maxima Backhouseana*,

With eleven flowers, was also a conspicuous plant.

In the class calling for a group of Chrysanthemum plants, 100 square feet, U. G. Agar, gardener to Fred Vanderbilt, Esq., was the only exhibitor, and it is questionable whether a better group of single-stem plants has ever been seen.

W. C. Russell, gardener to C. F. Dietrich, Esq., Millbrook, secured first prize for best bush plant, with Ivory, and the Allen prize with a monster plant of Puritan. Jas. Maharg, assistant to the above, secured the premier award in his class with a magnificent plant of W. H. Lincoln. Mr. Russell also put up six grand plants grown to single stem; his varieties were Mrs. Robinson, Mrs. G. Peabody, Vivand-Morel, Mutual Friend, and Philadelphia.

In cut blooms for best 12 white there were three competitors. A. Herrington was first with Mayflower; W. C. Russell, second with Mrs. Robinson.

For twelve yellow, A. Herrington was first with extra fine Miss Georgienne Bramhall.

In class for twelve pink there were also three competitors. W. C. Russell was first with Vivand-Morel of superb color, Mr. Herrington being second with blooms of greater size and stem, but lacking the color and freshness of the former.

For twelve crimson the first prize went to U. G. Agar, with G. W. Childs.

For twenty-five blooms to a vase arranged for effect with other foliage, open to private gardeners, there were four in competition. Richard Grigg was first with a fine blending of Japan maples and mixed yellow varieties. In the same class, open to all, the prize went to R. Grigg, gardener to Charles De Rham, Esq., Cold Spring, N. Y., with the same kind of foliage and white flowers.

The Sherman prize for twelve blooms on boards brought out six competitors and developed the keenest and best competition of the show. Mr. Blair captured the award with heavy, well-finished, high-colored blooms, his two weakest being Robert Bottomly and Mrs. G. Magee. His other kinds were Mrs. G. Pullman, Vivand-Morel, Miss C. H. Bates, Mrs. Robinson, Mrs. James W. Withers, Miss Florence Pullman, Minerva, Philadelphia, Lady Playfair, and Major Bonaffon. Mr. Blair also secured the Butterfield prize for twenty-four blooms with a grand lot, in this set was a bloom of Mrs. Peabody ten inches in diameter.

The Mitchell prize for twelve pink went to Mr. Russell.

For six yellow, first went to Hamilton Scott, Millbrook; second, to A. Herrington. Bonaffon was the variety exhibited.

For six white, first to A. Herrington with Frank Hardy; second to W. Turner.

For best 100 violets, first, Stanton Rockefeller, Rhinebeck; second, F. R. Newbold; third, J. W. Feeter, Highland, N. Y.

The Society's silver cup for the best 250 blooms went to C. F. Bahret, Poughkeepsie.

For the Plenty prize, \$25, for the best 100 blooms, there were eight entries, Stanton Rockefeller being the successful competitor. For best 100 singles Paul Gindra was first. Sloan Bros. staged blooms for exhibition only, which were very fine. G. Saltford, Rhinebeck, exhibited the pink Violet, Mrs. J. J. Astor.

In Carnation classes the first prize for 25 white, went to W. Turner, with heavy blooms of Flora Hill; second to G. Crawshaw, Newburgh; for 25 pink, first to Owen G. Owen, Monroe, with Triumph; second to G. Crawshaw. For 25 scarlet, Mr. Owen was again first with a grand lot of Jubilee. This exhibitor was also first for the best 12 white and 12 scarlet. Herman Asher was first for 12 pink. W. Turner secured the first for a collection of Roses, and Thos. Harrison captured the Mills prize for the best 12 Beauty.

The Mitchell Heater Co., Poughkeepsie, had at the rear of the hall sections of their greenhouse construction.

Our publishers will supply any book wanted. Send your orders.

## The Poultry Yard.

### The Brown Leghorn.

Pre-eminent among the breeds for laying qualities stands the Brown Leghorn, according to the great majority of fair-minded and disinterested witnesses. For beauty of plumage, for plumpness of carcass, for quick maturity, there is scarcely another in the whole list to equal it; perhaps there is not one that would dare to challenge it on all these points combined. The one thing it lacks is size, and it is scarcely fair to call this a lack, since the breed does not need it in order to fill—and fill well, its true place in the poultry-raising world.

It is because the thoroughbred is able to transmit its good qualities as the mongrel is not that it forms such a valuable portion of our poultry as a whole. And it is because feather and shape are the clearest and most prominent sign which we can have that any particular bird has received and is likely to be able to transmit the breed characteristics, that they are so important. For this reason it behooves every breeder to study them, whether he desires to deal in fancy poultry or not. This, of course, applies to all breeds, in common with the Leghorn.

Shape is considered so important a matter with the Leghorn, that the standard of perfection allows it 27 of the 100 points which go to make up a perfect specimen of the breed. Color of feathers, which some critics rave so fiercely against, receives no more points than shape. There is no weight requirement, and this fact has kept the breed small in size, though many of the judges exercise their own discretion, and give the prizes to the larger specimens, other things being equal.

Disqualifications are little understood, perhaps, by any but the breeders of fancy stock. They are defects showing the specimen to be so at variance with breed requirements as to be considered unfit to appear in a class devoted to the breed in competitive exhibit. These inexcusable defects in the Brown Leghorn are: feathers, or even down on the shanks or feet, twisted or falling combs (in the males), or twisted or crooked tailors backs, legs not a good yellow in color, white in the face, or in the plumage (with very slight exceptions). In rose-combed birds, the lack of a spike at the back of the comb disqualifies the bird.

The best way to get a good idea of the shape of a standard Leghorn is to study a good bird over and over again until the eye carries her picture and can decide instantly whether another bird has the same conformation. A good cut is better in some respects, as it gives the ideal form; but, inasmuch as one sees only a flat surface and no motion, a picture can give only a partial idea after all. It is almost impossible for a picture to give the pert carriage of a good Leghorn, the delightful knowingness of the way she cocks her head, the smooth chunkiness of her body, etc. But good cuts will show the pure whiteface and lobes, the required shape of wattles, bill, comb, the curve in back, and the proper fold of the wing.

The color varies much between the male and female. There must be a black stripe, running to a clean point, in the neck, or hackle feathers of both, but in the cock the ground color of hackle is red, or orange-red, while in the hens it is golden. The breast of the cock is black, that of the female salmon-brown. In the female there are a dozen different color divisions, and it seems almost a marvel that any birds can be produced which shall approach near to perfection in all. It is not possible to breed exhibition birds without having the standard for reference, and in connection with this, one needs sometimes to know just how certain judges interpret the standard.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

## A Rare Plant *Cycas Circinalis*

Stem 24 ins. tall, 9 ins. in diameter, 56 leaves over 6 ft. long. A grand specimen; price on application. Send for wholesale list of Palms. W. J. Heiser, Prop. Palm Gardens, Plattsmouth, Neb. Mention American Gardening when you write.

Sent on receipt of 10c. **RELIABLE INCUBATOR & BROODER CO.,** QUINCY, ILL. Mention American Gardening when you write.

## A Poultry Encyclopedia.

THE POULTRY KEEPER, edited by P. H. Jacobs, one of the best informed men of the age on poultry subjects, and who is aptly termed a walking poultry dictionary, has published four large pamphlets, covering every subject connected with the feathered tribe, which it entitles **ILLUSTRATORS No. 1, 2, 3 and 4.** The series constitute a veritable "**POULTRY ENCYCLOPEDIA**," covering the ground so completely that by the aid of the "**Four Illustrators**," and the regular monthly visits of the "**POULTRY KEEPER**," the reader can glean all the information necessary to become a successful poultry raiser.

You could not get any similar series in the whole world, even for \$50 each, for they do not exist. Were they given in regular book form with elaborate binding and colored cuts you would think them easily worth \$5 each, but what is wanted is not elegant printing, so much as valuable information that you can make use of. They have cost much in labor and cash, but we offer the set for almost nothing. A partial list of the subjects treated is as follows:

**ILLUSTRATOR No. 1.**—Poultry Houses, Incubators, Brooders, Coops, etc. 25 cents.  
**ILLUSTRATOR No. 2.**—Artificial Incubation, Raising Chicks, Testing Eggs, etc. 25 cents.  
**ILLUSTRATOR No. 3.**—Poultry Diseases, Lice, Gapes, Moulting, Egg Eating, etc. 25 cents.  
**ILLUSTRATOR No. 4.**—Judging Fowls, Description of Breeds, Mating, etc. 25 cents.

**\$1.50 Buys All This: \$1.50**

For \$1.50 we will send American Gardening, (weekly) one year, The Poultry Keeper (monthly) one year, and the Four Illustrators, as above.

ORDER NOW.

AMERICAN GARDENING, P. O. Box New York.

# Henry Strawberry Plant Premiums

Will be shipped to all who desire them this season until ground freezes.

Owing to the wonderful run on this unequaled Strawberry we are preparing 100,000 Henry plants for Spring delivery, and in this connection we desire our readers to remember

## Two Facts

1—The Henry Strawberry can be obtained solely through a subscription to AMERICAN GARDENING; as the publishers will not sell plants under any consideration;

2—Neither will Mr. Jerolaman.

## Who is Entitled to Plants

**New and Renewal Subscribers.**—Five plants of the Henry will be mailed, postpaid, as a premium to every Renewal or New Subscriber sending us \$1.00 for a year's subscription. When remitting be sure to state if you want this premium.

**To Agents and Workers.**—For every \$1.00 received from agents and others for New Subscriptions, we mail, postpaid, Ten Henry plants, Five to the New Subscriber and Five to the Agent.

## Special to Club Raisers!

**Clubs of Ten.**—To every agent sending us in a club of Ten New Names and \$10.00, we will forward in payment therefor One Hundred (100) Henry Strawberry Plants, by express, as well as send Five plants, postpaid, to each person in the club.

Mr. Jerolaman's series of articles has been put in pamphlet form; and agents will be supplied with copies on application. Best campaign matter out.

Address Your Letters,

**AMERICAN GARDENING,**

P. O. Box 1697, NEW YORK.

# WHOLESALE MARKET REPORT.

## New York.

In the cut flower market the demand has in no way caught up with the supply, and the result is a glut, with prices in the buyer's favor.

Chrysanthemums are excellent in quality, but realize little money. Good blooms only command 8c. to 12c. each, and the highest notch for specials is but 25c. In lower grades the price varies from \$1 to \$8 per 100, and among these are often excellent flowers.

Roses remain about the same—\$8 per 100 for No. 1 grade of general kinds is considered quite a fancy figure. Prices below that vary from 50c. to \$2 per 100, the highest for special Beauty being only 25c., but the majority fails to approach anything like that figure.

Extra Carnations are considered well sold if they reach \$1 per 100; more realize only 75c. Lilies bring \$1.50 per dozen; white Orchids 40c. each. Valley varies from \$1 to \$4 per 100. Fruits and vegetables show an improvement and the market gets cleared at some price or other.

American-grown hothouse grapes are not in demand at any price; occasional sales are made at 40c. per pound. European grapes are doing better than this and realize 75c. to \$1 per pound.

Cucumbers are selling briskly at 80c. to \$1 per dozen.

Mushrooms are over plentiful and the best only make 40c. per pound.

Tomatoes move freely at 20c. per pound, but will not make any higher figure.

Domestic grapes are moving much better than they were a year ago, and although prices as yet are not high. Delaware, Keuka, per small basket, 10@15c.; other state, per small basket, 7@12c.; Niagara, western N. Y., per small basket, 7@12c.; Catawba, western N. Y., per small basket, 7@8c.; Concord, western N. Y., per large basket, 10@12c.; western N. Y., per small basket, 7@8c.; inferior stock, small baskets, 4@6c.; white kinds, in trays, per 100 pounds, \$1@1.35; Catawba, in trays, per 100 pounds, \$1@1.10; Delaware, in trays, per 100 pounds, \$1@1.75; black kinds, in trays, per 100 pounds, \$1@1.35; very inferior, per 100 pounds, 50@75c.

Oranges—Florida, fair to choice, per box, \$3@4; grape fruit, bright, per box, \$5@7.

Nuts—Northern chestnuts continue scarce and firm; sales in range of \$5.50 @7 as to size and condition, southern quoted \$3.50@4.50. Hickory nuts firm at \$1.25@1.37, possibly fancy lots might reach \$1.50. Bull nuts quiet at 75c. per bushel.

Apples are doing well; pears and quinces are in slow demand.

Present quotations on apples are: Jonathan, western, good to fancy, \$3.50 @5; Albarmarle Pippin, Va., poor to fair, \$1.50@2.50; good to fancy, \$4@5.50; Wine Sap, Va., poor to fair, \$1.50 @2.50; good to fancy, \$3.50@4; Johnson's Winter, Va., poor to fair, \$1.50 @2.50; good to fancy, \$3.50@4; Snow, state, poor to fair, \$2@2.50; good to fancy, \$3.50@4; King, state, poor to fair, \$1.50@2; good to fancy, \$2.50 @3.50; Ben Davis, western, good to fancy, \$2.50@3.25; Ben Davis, Va., poor to fair, \$1.50@2; good to fancy, \$2.50@3; Greening, state, poor to fair, \$1.50@2; good to fancy, \$2.50@3.25; Baldwin, state, poor to fair, \$1.25@2; good to fancy, \$2.25@2.75; N. Spy, state, poor to fair, \$1.50@2; good to fancy \$2.50@3.50; mixed lots, poor to fair, \$1@1.75; open heads, poor to fair, \$1@1.50.

Pears realize as follows: Seckel, per barrel, \$3@6; per bushel box, \$1.25 @2.50; per keg, \$1.50@2.75; Beurré Bosc, per barrel, \$2@3.50; Keiffer, Jersey, per barrel, \$1.75@2.75; up-river, per barrel, \$1.50@2.25; Lawrence, per barrel, \$1.25@2; Beurré d'Anjou, per barrel, \$1.25@2; Vicar, per barrel, \$1@1.50.

Quinces—Apple, good to fancy, per

barrel, \$2.50@3.50; poor to fair, \$1@2. Potatoes from all appearances will realize a good price later; the prospects are that there are but few now to come in from the country.

Cauliflowers—Good to prime, per barrel, \$1@1.25; poor to fair, per barrel, \$@75c.

Celery—Choice to fancy, large, per dozen, 25@30c.; fair to prime, per dozen, 12@20c.; small and poor, per dozen, \$@10c.

Cabbages—Red, per barrel, 90c.; Jersey and Long Island, per 100, \$3@4; state, per 100, \$2.50@3.50.

Cucumbers—Florida, per crate, \$1.50 @2.50.

Egg plants—Florida, per one-half barrel box, \$2.50@3.

Green peas—Virginia, per one-half barrel basket, \$1@2.

Onions—Orange Co., red, prime, per bag, \$1.75@2.25; Orange Co., yellow, per bag, \$1.50@1.75; Orange Co., white, per bag, \$1.50@8; Orange Co., inferior, per bag, 75c.@1.25; state and western, yellow, per barrel, \$1@1.75; eastern, white, per barrel, \$2@5; eastern, red, per barrel, \$2.25@2.50; eastern, yellow, per barrel, \$2.

String beans—Va., green, one-half barrel basket, 15@40c.; Va., wax, per one-half barrel basket, 15@40c.; Charleston wax, prime, bushel basket, 50c.@1.25; Charleston, green, per bushel basket, 40 @65c.; Charleston and North Carolina, prime, per bushel basket, 15@30c.

Squash—Hubbard, per barrel, \$1@1.25; Marrow, per barrel, 75c.@1.

Turnips—Russian Canada, car lots, per barrel, 50@75c.

## Boston.

Since last week there is very little change to be reported in the market on vegetables.

Michigan hard-shelled Hubbard squash is \$17@20 a ton; Minnesota stock, mixed soft and hard-shelled, bringing \$12 @17 a ton. Near-by farmers are still supplying certain customers each morning with choice Marrow at about \$1 a barrel, giving them Bay State or Turbans at \$1.25 a barrel.

Choice onions are steady at \$2 per barrel; Spanish onions \$1.50 per crate of 50 pounds.

Light demand for shell beans; 50c.@ \$1.25 a bushel; string beans in fair demand, 50c.@ \$1 a basket; white French turnips, 75c.@ \$1 a barrel; yellow, 75c @80c., white flats, 75c.@ \$1.

Mint 40c. a bushel; parsley 50c., radishes 28c. a dozen, spinach 25c. a bushel, parsnips 75c., carrots 75c., beets 50c.

Florida oranges 150-176 count bring \$4@5, according to count. Grape fruit \$6@8 according to count and quality.

Cauliflower steady, fancy 10@15c. a head. No better demand can be reported on cabbage, as the market is overstocked; it is selling at \$3c. a head.

The feeling on hothouse cucumbers is a little firmer, although the price is same as last week, \$6@8 a hundred; fancy assorted little more.

Hothouse lettuce in very good demand at 25@40c.

Mushroom demand very dull; price took a drop from 75c. to 30@50c. a pound, market fairly well supplied.

Market on hothouse tomatoes firmer, selling 20@25c. a pound.

Hothouse grapes 25@50c. a pound.

Potato market easier if anything; Green Mountain bringing 75c. a bushel; Hebrons 75@80c.; sweet potatoes are off from the boom of last week, selling \$1.75@2 a barrel.

Seckel pears are about out of the market; good stock \$3@4; Duchess \$1.50 @1.75; if very fancy \$2; Beurré Bosc, \$2.50@4; Beurré Clairgeau, \$2@2.50; very choice stock \$3.

Cranberries no firmer than last week, selling crates \$1.75; barrels, \$4@5.

Home-grown quince \$1.50 a bushel; some choice stock little more.

Boston Market celery selling \$1.25@

.50 a dozen. German celery or celery  
oots selling at 75c. a dozen. Brussels  
prouts 10@15c. a quart.  
Apple market very firm; fancy red eat-  
ing apples \$2.75@3.50; Greenings and  
haldwins \$2.50@2.75. Some very fancy  
travenstein apples sold at \$5.50 a bar-  
el.  
Large basket Concords 12c., Niagaras  
2c., Salems and Catawbas 13@14c.;  
ame varieles in small baskets 8@10c.  
Chestnuts \$6.50@7 a bushel; shell  
arks \$1.50 a bushel.

Your journal is a wonder in price con-  
sidering the size and general get-up and  
value of its reading matter.—F. C. S.,  
Calumba, Angaston, So. Aus.

Nitrate of Soda

is the best and cheapest form  
in which you can buy nitrogen  
(or ammonia). It is also the  
most soluble and available  
form in which nitrogen can  
be applied as food for plants.  
You can mix it yourself with  
other materials in just the  
correct proportion for the  
particular crop to which you  
wish to apply it. You cannot  
raise good crops without nitro-  
gen in some form. Why  
not use the best—Nitrate?

Free A 40-page book, "Food for Plants."  
Tells all about mixing and using  
fertilizers. Please ask for it.

SOME BARGAINS IN CLUBS FOR Men, Women and the Young.

- Ohio Farmer, a plant among the agri-  
cultural weeklies, and American Gardening.  
The two, one year, For \$1.60.
- Farm, Field and Fireside, a 32 to  
40 page weekly Farm and Family Journal,  
the best of its class, and American Gardening.  
The two, one year, For \$1.50.
- Country Gentleman. This weekly am-  
ply covers the field its title indicates. Every  
country gentleman should subscribe to it.  
And American Gardening.  
The two, one year, For \$2.75.
- Farm Journal, the "little giant" of  
monthly journalism in matters agricultural,  
and American Gardening.  
The two, one year, For \$1.25.
- Farm Poultry (semi-monthly), and  
American Gardening.  
The two, one year, For \$1.50.
- Poultry Monthly and American Gardening.  
The two, one year, For \$1.25.
- Above is your choice of two most excellent  
poultry magazines. And nearly every one  
of our readers keeps poultry. Why not  
subscribe to both? The two poultry papers  
and American Gardening, one year, For  
\$2.25.
- Meehan's Monthly, a horticultural  
stand-by, and American Gardening.  
The two, one year, For \$2.85.
- Harper's Magazine, as good as ever;  
none better among the literary monthlies,  
and American Gardening.  
The two, one year, For \$4.25.
- Ladies' Home Journal, an unrivaled  
monthly for women, the standard in its  
class, and American Gardening.  
The two, one year, For \$1.90.
- Youth's Companion, of Boston. At  
the head of all journals for both boys and  
girls, and read by the elders, too. New  
Subscribers Only and American Gardening.  
The two, one year, For \$2.85

OUR CLUB LIST

LET US FILL YOUR ORDERS FOR 1898.

Below we print a comprehensive list of the leading publications  
of the day. When more than one is wanted in club we will be  
pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club  
with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends  
to place their orders through us and to enable them to obtain their literature at a great  
saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or  
magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second  
column [B] our price, including AMERICAN GARDENING for one year.

FIG. 219.—A SEASONABLE REPRESENTATION.

In the midst of the rush of Chrysanthemum exhibitions it is not inappropriate to present a view of that recently held at Morristown, N. J. It is fairly representative of many others and the fact of its not being large makes it more suitable for our purpose.

On the first table to the left are specimens of Major Bonnafon and Philadelphia. The left end vase on the next table are the fine Good Gracious with Evangeline to the front and right. A collection of Orchids is seen on the other end and another on the next table. The central group on the side is that of Mr. D. Willis James. Vases of American Beauty Roses are prominent on the near tables.

## Some Fruit Comments From the American Institute.

The apples in a very fine exhibit from Allen Co., Kansas, Horticultural Society were not as large or as well colored as some others shown, but were without blemish, and with a clear skin that looked like wax.

Mrs. W. R. Stuart, Ocean Springs, Miss., sent in several varieties of pecans, some of very large size and thin-shelled, with large sweet meats which separated easily from the shell; some were exceptionally fine. Mr. P. J. Berckmans, of Georgia, had a very fine exhibit of fruit, more especially Kieffer pears, persimmons, and pomegranates. The Kieffer pears attracted a great deal of attention and were from two to three times as large as those grown in the North.

A large pineapple plant in fruit was sent from Orlando, Fla., and attracted much attention.

Some very fine apples were shown from western North Carolina and were a revelation to many, as it was thought that good apples could not be grown so far south; they were grown at from 3,000 to 4,000 feet elevation. Most of the varieties were not known in the North to any great extent.

Bradford Co. Horticultural Society of Virginia, also Mrs. J. J. Miller, Washington, Va., and Geo. C. Morrell, Coleman's Falls, Va., sent in exhibits of very fine apples, some varieties being better grown than in the North. Newtown, Winesap, Smith's Cider evidently do much better there than in New York state.

There were a few apples sent in from Maryland and New Jersey, but they did not rank well in size or color.

Mr. Killen, of Fulton, Delaware, showed some very fine chestnuts. Killen was very large and of good quality. Early Harvest, a Japan chestnut, exhibited by the above, was of good size, and very sweet, and was said to ripen extra early. Mr. Parry, of Parry's Nurseries, N. J., had a very fine exhibit of nuts; his Superb and Parry were very large.

Mr. Corby, of New Jersey, was on hand with his grapes, and as usual took the premiums. I do not think that a finer lot of grapes can be exhibited by one man in the Eastern United States.

Ellwanger & Barry had a very fine exhibit of pears. Most of these varieties were very large in size, their Anjous especially so; they were awarded first premium. There were also three fine collections of apples from Schoharie Co., also from W. S. Treator, Red Hook, Dutchess Co.; White & Rice, Yorktown, and three or four others. The Eastern New York Horticultural also made a very fine exhibit.

On collections of 50 varieties of apples, White & Rice, Yorktown, Westchester Co., were first, W. S. Treator, Red Hook, Dutchess Co., second. Mr. Treator's exhibit was the most neatly labeled of any individual exhibit at the show.

On collections of 25 and 10, Mr. Boggs, of Wayneville, North Carolina, was easily first; White & Rice second.

On the collection of 10 varieties, one could see no difference between the two collections; it was given to Mr. Boggs because it was said that White & Rice had two plates of apples poor in flavor, although well grown. Many of Mr. Boggs' apples are not much grown outside of the South; of apples grown in the North and South, Newtown Pippin, Winesap, Smith's Cider, and one or two other varieties seem to do better there, while Spy, Fall Pippin, Greening, King, Hubbardston's Nonsuch, were much better grown in the North.

For the largest and best exhibit by any horticultural society, there were three entries—one from Kansas, one from Bradford Co., Va., and the Eastern New York Horticultural Society.

The New York State Society was far ahead of the others in number of varieties—about 150 of apples, 35 of pears, 36 of grapes, 15 of peaches. Some of the varieties were not very well grown, but from the well-sprayed orchards the fruit

sent was in size and color equal to, and in some cases better than, any sent from other states, just as smooth, and as far as flavor is concerned could not be surpassed. Kansas and Virginia both had about 60 varieties of apples and were given special premiums.

Some varieties of apples which are not yet very common are being largely planted. York Imperial stands at the head of this list; its peculiar shape, smooth, waxy skin; bright color, good flavor, earliness of bearing, popularity in this and the English markets (in the last but little under Newtown Pippin in price). It looks as if it would be one of our standard apples.

Gano is, as Mr. Van Deman says, "an improved Ben Davis." It is of almost the same shape, little better in quality, of a very bright red color, as red as Jonathan, which will make it a popular stand apple.

Missouri Pippin, as grown in the West, and Smith's Cider and Winesap as grown in the West and South, are very pretty apples, but do succeed well in New York State. Probably the two finest plates of apples on exhibition were a plate of Wolf River, from Mrs. Chas. Krom, of Schoharie Co., and a plate of Fall Pippin from Edw. Van Alstyne, Kinderhook. Many visitors said they were the finest fruits they had ever seen. The latter variety is now a popular apple in New York market. Many hours could have been profitably spent by any horticulturist looking over the different collections, and talking with individual growers.

B. D. VAN BUREN.

## Nitrate of Soda and Chrysanthemums.

After the bud is set is the safest and best time to use nitrate of soda. If used during the growing season it is too apt to excite the plants into making a soft sappy growth, running up quickly and not building up the wood or stem properly. Our experience has shown us that used after the bud is taken its effects are very marked. Particularly is this the case with crown buds. Applied about every other week at the rate of 12 to 16 ounces in a 86-gallon barrel of manure water (other fertilizers of course being used in the meantime) it helps the bud to break through its hard, husky covering and hastens its development by 10 or 12 days. The foliage on our Bonnafon this year was a little pale and we used more nitrate than usual, with the result that Bonnafon was in good shape for cutting by October 18 while last year we could not cut a flower before the 30th. Nitrate should always be dissolved in water before applying. It is much the safest way. If sprinkled in the soil and watered in it oftentimes causes the bottom leaves to fall off.

C. TORY.

## Our 1898 Art Calendar.

This beautiful gem of art, it would seem, is destined to find great favor among our subscribers, and the orders for it are now coming in rapidly. We still have a good supply in hand, but in order that all of our friends who want it may feel secure they will receive theirs we would advise early applications to be sent us. For particulars as to how it may be obtained, see advertisement on page 780.

## Our Strawberry Pamphlet.

Owing to an expressed desire by the writer to thoroughly revise his series of articles on "Big Berries for All," it may be early in December before we will be able to issue the booklet. It will be well worth waiting for, however, as we confidently anticipate that it will prove the best treatise on the subject ever written, and practical to the core.

## The Window Garden.

### Pot Culture of Narcissi.

Among all the bulbous families, it may be doubted whether there is another so generally useful for pot culture as that of the Narcissus. This being the case, it seems strange, indeed, that the only member of the family to be really well-known, popularly, should be the Chinese Sacred Lily, which is far from being the most beautiful. Neither can it be fairly said that it is easier to grow than several others, while there are a number that are cheaper. This sort has three points in its favor as a popular forcing bulb: it forces in a very brief period, it bears many blooms to the bulb, and it has a popular name, with a pretty, if mythical, story attached. But it is not the best.

The Narcissi belong to the Amaryllis (Hippeastrum) family, in which (and in the Liliaceae) are found a very large proportion of our forcing bulbs. Few besides the botanist do distinguish the one family from the other, in many instances, so similar in appearance are the blooms. The distinguishing point, most easily taken note of is the position of the ovary, or seed-pod. In the Lily family it is above the petals, or main portion of the blossom. In the Amaryllis it is below the blossom.

Among these last, and thus allied to the Narcissus, are found the Snowdrop, the Snowflake, and the bulbs popularly known as Fairy Lilies, as Tuberoses, and as Jacobean Lilies. Narcissi are themselves divided for convenience, into the Trumpet section, the bunch-flowered, the doubles, and the rush-leaved, the latter being known as Jonquills.

Several forms of the Narcissus grow well in water. These comprise the Sacred Lily, the Paper-White Narcissus, the sort catalogued by some as Giant French, and the Campernelle Jonquil. Other of the bunch-flowered sorts may be tried.

In pots, however, a good selection of varieties may give us bloom from Thanksgiving time until almost the season for outdoor bloom. Nor need one acquire many sorts in order to have this succession, for some bulbs of the earlier sorts may be held back long enough to make a very good season.

Early potting—about as soon as the bulbs can be obtained—cannot be too strongly urged. When the bulbs are well-ripened and ready to grow, they are more than likely to be injured by storage beyond the proper season. If potted and brought on in a cool temperature, they will only grow better by a long, slow period of root formation. Almost any fairly sandy soil will do, and after the roots are well grown, most of the kinds will bear rather free watering.

Narcissus poeticus, and its improved, earlier form, ornatus, have not always been found satisfactory. But the difficulty doubtless lies most largely in the fact that they have been forced too hard. A temperature of 45 degrees is high enough to begin with, and it is safer to push along very steadily, at not too great a rise above this point. Many of the varieties can be brought along nicely in about the same amount of heat. There is always some complaint of blasted buds. This need not usually occur, if a cool temperature be maintained, and strong sun-heat in south window be avoided. Perhaps east windows are best, all things considered. Paper White and the Sacred Lily will come on all right in the temperature of the average living room, in time for Thanksgiving if potted very early, the last needing but three to five weeks if in water, perhaps a little more in earth.

Some other kinds to select are the Tenby Daffodil, Ard Righ, Golden Spur, N. Princeps, N. pallidus præcox, Stella, Double Roman, Von Slon, and White Pearl. A beautiful modern sort is known as Barril conspicuus. It has a sulphur perianth, with a short, spreading cup, illumined with scarlet. It should certainly be tried by every one who loves the Narcissus.

MYRA V. NORTON.

## Propagating Blackberry Plants from Root Cuttings.

For the purpose of root propagation it is desirable to have the roots which have made their growth the previous year, older roots may be used, but not so large a per cent. will grow.

In nurseries where a business is made of growing root-cutting plants the roots are taken up when the fall work is closed during the latter part of November or at any open spell in December before freezing-up time.

I have had good success in taking up roots in January, where the surface of the ground was protected by snow back of a piece of woods which protected the block from the west winds. The roots seemed to callus over perfectly before spring. After being cut into proper lengths they were buried in a pile covered with sand and long manure, as is described later.

A two-horse team and plow are started around the block and only one furrow at a time turned over, while men with five or six-tined handle forks fork out all roots that are of proper size to cut. Then another furrow is turned over and managed in the same manner. After four or five furrows are thus cleared, one or two boys take up in bushel baskets the roots thrown out, and from three to five heaping basketfuls are placed in piles which are spread out and sand mixed in to prevent heating until the roots are hauled to the proper place for cutting up. After the pile is finished, it is covered with five or six inches of soil to keep out frost until it is desired for use, when the roots are taken out and hauled to the cellar for cutting up.

### Cutting Common Varieties.

If common varieties like Snyder or Taylor's Prolific are to be used, set the guard on a common lever handle cutting box, (the roots being straightened out in the box) so that they will be cut in pieces of about one and one-half to two inches in length. If only a small quantity of roots are to be handled they can be straightened out and held by one hand and with a sharp axe in the other, cut into the lengths desired; the length being governed according to the size of the roots.

### Cutting Scarce Varieties.

If the variety is very scarce and it is wished to cut every root to the best advantage, I would advise cutting each one separately with a sharp budding knife or jack-knife. The lengths to be governed by thickness of the roots as shown in the accompanying illustration (fig. 220). Many more roots will grow when cut this way than by either of the former methods, as the downward stroke of the cutting box or axe bruises the ends of many pieces.

### Storing to Callus.

The pieces of root after being thus prepared are placed in shallow boxes (soap boxes which can be purchased at the grocery store are as convenient as any), in alternate layers of roots and sharp sand, taking care that the sand is not too moist, nor so dry as to cause the roots to dry out. The greatest danger is in getting the sand too moist, causing the ends of the roots to decay instead of forming a callus. The cellar in which the boxes are stored, being of course free from frost. About the middle of the winter, it is a good plan to examine the roots in the boxes to see that they are in good condition.

Burying the boxes in trenches below the frost line has been a success; they came out in good shape. But care must be used that the trench is not made where the bottom of it will be too moist, and it is well as a precaution to place some pieces of wood or board in bottom of the trench on which to place the boxes. After the trench is filled the top is rounded to carry off water when it rains.

Another plan I have tried with success when the roots were cut and gathered in an open spell in January is as follows: Cut a few roots and spread them out

evenly over the surface of the ground the size wished for the bottom of the pile; then add a layer of sand, throwing it on with a sort of sweeping motion from the shovel, that it might be among all the roots and deep enough to cover them from sight only. Then another layer of roots is treated in the same manner, and so on till the heap is finished. It is then covered as follows: About 10 inches of soil, then a covering of one foot of long manure (horse manure much the best), and a good covering of old straw over all. In this way roots will callus very rapidly, no boxes are needed and there is no hauling from the field.

### Soil.

If I could have my choice of soil, I would select a rich sandy loam with a subsoil of part clay inclined to be sandy; but I have seen good first-class blackberry plants grown from root-cuttings on leachy subsoil overlaid with sandy loam of a rather light texture. In some seasons rich clay loam will grow long and large roots but not enough fibrous

FIG. 220.—ROOT CUTTINGS OF BLACKBERRIES WHERE IT IS DESIRED TO MAKE THE BEST OF EACH PIECE OF ROOT.

Exact size of choice varieties cut with sharp knife.

ones, but the clay soil grows a very desirable root from which to propagate for cuttings.

Upland which has natural drainage and on which some cultivated crop has been raised the previous season, I would prefer. One of the most tedious parts of the work in growing blackberry plants from root cuttings is having to get down on the knees all day in the heat of the sun and pull weeds by hand from among the briars; the hoe can be used to advantage only on the sides of the row.

C. C. NASH.

### Propagating Holt's Sage.

I presume this sage is like the common variety, with regard to its propagation. We get our stock by dividing old plants in spring time. One turned out to be a fine pink-flowered variety, and showy enough for the border. I took soft wood cuttings of this, and all rooted quickly. They were kept in a cold frame until spring, and when planted out, made large stools by the autumn. Your Canadian correspondent, page 779, can do likewise.—T. D. H.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

## The Vegetable Garden.

### Economizing the Manure.

This is one of those important factors in successful gardening that as a general thing receives no attention; the manure is swept up in the stable every morning, thrown into a wheelbarrow, then dumped outside in an untidy pile, and left to the elements to have its potash washed out by the rain, and the ammonia to escape with it, or to the atmosphere. When we put a fork into the heap and find it "fire tang," we know there is little plant food left, and that the pile is of practically little value other than for the humus. Left in such a manner over winter, it has depreciated in value at least 50 per cent. before it is applied to the land, and, to make up for that which is wantonly wasted, fertilizers are bought "to help the things along."

### Uses of Liquid Manure.

To make sure the waste is carried on scrupulously correctly, the urine of the horses and cattle is carefully drained away into the sewer, to grow sea weeds or bullrushes! One would imagine such matter contained some pestilence, or contamination, and was unfit to have around. Still, all realize the value of liquid manure for all crops. There is nothing equal to it for cabbage, cauliflower, celery, etc., if applied during the growing season. At other times it can be given to the asparagus beds, rhubarb, etc.

The value of the stable drainage being recognized, it should be preserved. It need not cost much to build a cistern under ground, by digging a good hole in a convenient place. Make some cement, one part Portland cement to two parts good sharp sand, plaster with this carefully all round and at bottom, with a few courses of brick near the surface to make it strong to stand upon, cover with a few planks, place a cheap pump upon this, and all is complete. If the drainings from the stables and barnyards, and all sink water from the house or wash-tubs are run into this, and by the use of a water barrel carried into the garden, there will be some effect.

### Roofing the Manure Heap.—Land Plaster.

There should, by all means, be a cheap roof erected over the manure heap, to keep off all rain or snow. If every owner of a horse, cow, or chickens, really knew the value of land plaster for fixing the ammonia in the manure, they would see to it that a barrel of it was always handy, and that it would be sprinkled in the stables every morning after the manure is cleaned out. This will largely prevent fire tang and preserve all plant food that is in the manure.

Plaster should always be used sprinkled round all horses that are kept in the same building as fine carriages to absorb the ammonia, as this gas is detrimental to the paint, and its absorption keeps the building sweet.

### Chicken and Stable Manures.

Chicken manure treated as above and kept in barrels in a dry place until required for use, is nearly as valuable as the best fertilizer that can be purchased.

The manure from horses and cattle should be kept under a dry roof, otherwise the rain would dissolve it, but if kept dry better results will follow its use, than from manure that is not taken care of.

W. M. EDWARDS, Conn.

### Perforated Tile for Greenhouse.

If your correspondent, G. M. Stratton, will refer to page 788 of last issue of AMERICAN GARDENING he will find that we advertise Perfect Drainage Bench Tile.—HITCHINGS & Co.

—The porous tiles for greenhouse benches referred to by your correspondent can be procured from me.—HENRY W. GIBBONS, 186 Liberty street, New York.

### Peppermint as a Crop.

To grow peppermint successfully, the inquirer on page 779 should see that he has a good heavy wet loam; that is the first requisite, then comes clean culture; after which are natural conditions, which must be favorable to the production of the crop, or the active principle for which the crop is grown will be deficient. There are many localities where the plant will grow freely, but in very few does it yield paying quantities of oil.

Peppermint must be planted in the spring as soon as it is possible to work the ground, as the roots start very early. Plant in rows three feet apart, setting the plants one foot apart in the row. When the plants to be set are taken up they must be kept wet until planted, and be set in moist earth. Keep the ground entirely free from weeds, as they spoil the flavor of the desired oil. Constant cultivation must be kept up until the first of August, when the plants begin to throw out runners, and the blossoms appear, and the crop is ready to distill.

Those who thoroughly understand the business have made it profitable. But within the last few years there has been an over-production, and the industry has not been a paying one. We should advise anyone interested to visit Wayne Co., N. Y., where it is the principal crop.—Ed. A. G.

### Propagating Small Fruits.

When not many are required, E. F. L. is informed that blackberries and raspberries are propagated by planting suckers from the old stools. If wanted in quantity, dig out the roots of blackberries and cut into two-inch lengths and store them in sand where they will be free from frost. Plant one inch deep in spring and cover with a fine mulch of some kind. Propagate blackcap raspberries by layering the tips; currants by cuttings 8 to 10 inches long; taken in fall and stored like blackberry roots, or planted direct in lines outside. Mulch to prevent heaving by frost.—J. HOLLOWAY.

The blackberry may be increased either by root cuttings or by pegging the points of the shoots down, covering with soil.

Currants may be increased either by cuttings, layers, or suckers. Cuttings is the plan most generally practised, selecting strong, well-ripened wood of the present year's growth, cutting them into lengths 12 or 16 inches long, setting them out in well-drained soil 6 inches apart in the row and 12 inches between the rows.

Raspberries may be increased readily by taking root suckers which spring up some distance from the old stool and are easily transplanted.—T. H.

### Chrysanthemums Not True to Color.

Vivian Morel and Mrs. George Magee (of which inquiry is made on page 779) color according to which bud is taken. Crowns and early buds produce large heavy, light-colored flowers, and later or terminal buds vice-versa. Apart from the bud the first-named variety frequently varies and sports in color.—Ed., A. G.

### Fertilizer for Berries.

Replying to J. M. C., Mich., page 779, to every six cartloads of mulch and rotten sawdust, apply one of lime, one barrel bonedust; if the ashes are leached, throw them into the heap as well. Mix the whole thoroughly in a tidy heap, and leave to decompose over winter. Before spreading on the ground, it should be carefully turned over to incorporate the whole. Cover the berry patch with this composition one to two inches thick, then fork or cultivate lightly into the soil without disturbing the roots. If correspondent will burn all the sawdust and make as much wood ashes as he can, keep dry, and apply in spring 1,000 to 2,000 pounds to the acre, and 500 to 1,000 pounds according to fertility of bone dust per acre, worked into the soil, he will get some berries. Wood ashes and bone dust are the best fertilizers for

fruit. The above composition of muck, lime, etc., should prove excellent for berries.—W. M. EDWARDS, Conn.

### Early Celery Bolting.

A., Mass., (page 779) is informed that there is nothing unusual about early started celery running to seed in the greenhouse, especially if kept warm. The seed will germinate nicely say in a temperature of 50 degrees, and after the seed is up the plants should be grown on in a cool airy house. The plants must be kept stocky; if drawn up spindly and weak, they are of little use. At the same time I would not advocate starting celery very early in the greenhouse, the end of February or first of March suits our purpose. Two years ago I started a little celery early in February, variety White Plume; the result was nearly every plant bolted in August, while the later planted was all right. Golden Self Blanching or White Plume answers the purpose for early celery.—WM. TURNER.

The reason your celery bolted was owing to maturing so early in the season at which time conditions were favorable to still encourage growth, the natural tendency of which would be to go to seed or bolt. This is often the case with early celery. After the celery is fit for use, the object should be to retard growth as much as possible by banking it up well. The variety Paris Golden Self-Blanching is good for early use, as also is White Plume.—T. H.

On page 779 A. Mass., writes that the Golden Self-Blanching that was sown early and planted out last of April, did well, and by end of June was ready for use, but had mostly run to seed, while seeds sown from same package for a later crop did not run to seed. Celery sown so early frequently bolts in this manner. I have found that seedlings grown in heat of 60 to 75 degrees, transplanted into flats and planted out of doors, when the temperature frequently drops to 45, or even 40 degrees, nights, is very liable to bolt. But that if it is grown in a heat of 50 to 65 degrees, when ready transplanted into flats, gradually hardened off in a cold frame, and when the weather is settled planted out of doors, and not permitted to become very dry at the roots at any time, very little of it will bolt, not more than 5 per cent.

Celery is a true biennial, and before it goes to seed it must receive some check during growth; this may be done as suggested above; it is a hardy plant of course, when left in its natural state, but when started early in heat, it becomes a hothouse plant, and as the query suggests, receives a check by growing it this way and setting it out in Massachusetts in April, before the ground is as warm as was the place where it was previously growing.—W. M. EDWARDS.

### Keeping Gladiolus Bulbets.

Your correspondent, H. M. D., has perhaps allowed his bulbets to become too dry. I have found they keep best in moist earth, just sufficient to keep the air from them; then put them in a dark cellar where the temperature does not fall below 32 degrees, and but very little above. It is much better to have the temperature 25 degrees than 50 degrees, as slight freezing does not injure them. It is better by far to peel before planting, we should not think of planting choice varieties with their shells on.—A.

Pack them in dry sand; do not peel them. As soon as the ground is warmed and can be worked, plant in a well prepared bed about six inches apart, watering them in dry weather; when they have grown about six inches high, give a light mulch of rotten manure.—T. H.

When lifting Gladiolus in the fall, spread out in a dry airy shed to thoroughly ripen up the corms, leaving the old growth on the corm, until it just needs a touch to separate them; then the corm can be stored away in any dry cool place. It is not necessary to keep in sand. A temperature of 40 or 45 degrees will winter them safely, providing they

are perfectly dry. I should allow nature to do the peeling, with such treatment as above, and plant in the spring in good rich soil, setting the corms three inches in the soil, and nine inches in the row. There should be no trouble in getting all the corms to start off in good shape in the spring. To have a supply of flowers a planting can be made in April, May, and June.—WM. TURNER.

I have had some experience in wintering and growing Gladiolus bulbets and very cheerfully give to H. M. D. what information on the matter I can. On taking up the bulbs in the fall I carefully separate from them all the bulbets that seem to me worth preserving and spread them where no frost can reach them and they can become thoroughly dry. I then tie them up in a paper bag, without any sand or other such material, and hang them from one of the beams in the cellar. They have always kept with me satisfactorily when thus treated. In the spring I sow them as I do sweet peas, but in a furrow only about an inch deep, and they come up freely.—W. H. W., Mass.

H. M. D. (page 779) is advised to keep his bulbs which are in sand, dry and at a temperature of from 50 to 60 degrees. Plants same as peas and grow on in the same way.—ED. A. G.

### Jasmine Not Growing.

Evidently the Jasmine of the inquirer on page 779 got checked at the roots when first potted and possibly the soil got soured by overwatering. See if the soil is fully run through by roots; if not, reduce the ball of earth carefully, and pot up in a smaller pot.—Ed., A. G.

Evidently your Jasmine is not in good health; you would stand a better chance of getting assistance if you would be more explicit in regard to the conditions under which you are growing the plant.

Jasminum gracillimum to grow successfully requires greenhouse treatment with a temperature of 65 degrees to 70 degrees, using a compost of good turfy loam, manure, and coarse sand. When it has got firm hold of the soil, give it liquid manure once a week. It is a winter flowering species.—T. H.

Jasminum gracillimum requires handling with care. If the soil be heavy, if potted in an over-sized pot, or kept wet, it would become in the condition described by your correspondent on page 779. House plants generally do not get air enough, and often are given strong doses of artificial fertilizer when sick, and this only makes them worse. No doubt the soil has become sour.

I should recommend re-potting in a smaller pot, with lighter soil, using a few pieces of charcoal along with the drainage.—T. D. H.

### Wintering Strawberry Plants.

The boxed plants of J. J. S. (page 779) will go through the winter all right if plunged in the ground where water will not lay in winter. At the approach of hard freezing weather, say in the beginning of December, cover with one inch of salt hay or leaves, laying a few pieces of brush on the top to prevent it blowing away before snow comes. They could be wintered in cold frames, but would require more attention, as they would be apt to damp off, and much would more likely work among them when under cover.—J. HOLLOWAY.

### Growing Dwarf Apples.

(Replying to L. J. F., page 779), the tree should be bought when one year old and cut back to about 18 inches from the ground. They should then produce five to seven shoots. Train in summer to the desired form and stop in early autumn. The following summer the shoots from these except the leader should be stopped when they have made five or six leaves and any secondary ones, at two or three leaves, working out by the leaders the form wanted. If a

pyramidal form, be sure to get a broad base rather than height. This style is not much practised in this country. It has moreover a serious drawback. The trees are short-lived.

The trees are generally budded, which is said to produce a stronger tree in a given time than root grafts. The stock used is the Paradise stock. All dwarf apple trees, if planted too deep, will make roots above the stock and become virtually half standard.—J. HOLLOWAY.

### Why Pinks Don't Flower.

Why the pinks of J. L. B. (page 779) don't flower is a hard matter to tell, with so little information. In wet soil or poor light, the buds would not open. I imagine the plants were taken from the open ground full of buds, kept in the shade too long, and over-watered.—T. D. F.

There are different causes for Pinks or Carnations not opening their flowers. The question on page 779 could be easily answered, if one just knew the treatment the plants have been used to. However, supposing those Carnations are planted into a good house where there can be a night temperature say from 50 to 55 degrees, with a rise of 5 or 10 degrees during the day, with plenty of fresh air at every chance, avoiding sudden changes, the flowers ought to open. To have good flowers disbudding should be done, just leaving one bud to each stem. The plants are capable of carrying a heavy crop.—WM. TURNER.

### Greenhouse Heating.

Replying to the inquiry of R. Sinclair on page 779: (1.) Good results can be obtained with the pipes arranged as described, but it would be better to carry a 2½-inch pipe from the boiler to the farther end of the greenhouse and then use a 2-inch pipe to connect with each of the side coils. The 2-inch openings into the boiler should be enlarged if it can be readily done, but it will answer to reduce the pipes at the boiler and enter through 2-inch openings. The expansion pipe can be connected with any part of the system, provided there is no shut-off valve between it and the boiler. When a down-hill flow is used I like to connect with the highest part of the system and thus do away with an air cock.

(2.) For the greenhouse use one linear foot of 1½-inch pipe for every two square feet of glass for 50 degrees, and for 1½ feet of glass for 60 degrees. For a dwelling house the amount varies with the amount of window surface and of exposed wall surface, but generally a square foot of radiation will suffice for 30 to 40 cubic feet of space.—L. R. TAFT.

As no data is furnished by G. M. S. (page 779), I can estimate in a general way only the amount of exposed surface in the side walls. The only way a range of temperature such as that given (40 to 75 degrees) can be secured is by providing the radiation required for the maximum temperature in severe weather and then depending upon valves or manipulation of fire and drafts to secure the minimum temperature.

To provide a temperature of 75 degrees in house No. 1 two 2-inch flows and six 1½-inch returns will be required. Valves should be provided by which at least one-half of the pipes can be cut off as desired.

For house No. 2 I should use the same number of pipes as in No. 1. In house No. 3 use one 2-inch flow overhead and three 1½-inch returns under the propagating bench.

I should prefer to put in a heater of ample size to warm the houses described, and then when others are added put in another. This will not only be more economical for the present, but after the others are added one heater would be of a sufficient capacity to heat all of the houses in mild weather and the other heater can be held in reserve for severe weather or for use in case of an accident to the large one.

I would now put in a heater rated for 1,000 square feet of radiation, which will

need about five square feet of grate and 100 of heating surface. The other heater will need to be of a capacity for 880 feet of radiating surface, with about four feet of grate and 80 of fire surface. Of course the relative areas of grate and fire surface will depend largely upon the construction of the heater.—L. R. TAFT.

### English and American Tomatoes.

To the Editor of American Gardening.

Just a word on a house of tomatoes. They talk of old-country sorts, but can the Lorillard be beaten? If so, they must be monsters. I have here a house of the Lorillard I started August 26 and to-day will say the fruit cannot be beaten, for one measures 7½ inches across and it is the finest crop you ever saw in your born days; every bloom has set.

My idea for setting them is great. I have a skep of bees placed as shown in fig. 221 at the end of the house, so the bees are out of the way. No one need be afraid of getting stung, for no one ever knew of bees stinging except when interfered with or struck at. They do a host of work for me both in my tomato house and graperies when the vines are in bloom. I move the skep in then. One would hardly realize the help these bees are to me and I never was stung.

Now not only the bees I admire, but also my tomatoes. I planted them in pure loam with one-third cow manure

FIG. 221.—ARRANGEMENT TO FERTILIZE GREENHOUSE TOMATOES.

mixed together, with a layer of fresh horse manure spread over the bench for drainage. Planting my tomatoes 18 inches apart I run them single stem, and when they have grown to their limit I start another lot to follow. I have to-day on average, about 45 to 60 tomatoes on each plant and stems are like spade handles. I don't believe in cutting off a leaf and never syringe overhead nor allow them to get too dry nor too wet. I don't use too much manure after planting, for they then grow too much and rob the fruit. It would do one good to see these tomatoes. I won't say any more on this. But they talk of old-country sorts. I would like to see the one to beat Lorillard. J. FRASER, N. Y.

"I've got something nobody else has got," said the wealthy New Yorker, who has been experimenting with raising fancy fowls over in New Jersey. "What is it?" "I bought a \$175 incubator, put \$25 worth of eggs in it, and hatched out a blue-bottle fly. I've got the only \$200 blue-bottle fly in this or any other country."—Texas Sittings.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere

### The Fruit Garden.

#### Manuring Fruit Trees.

This is necessary work at some time, and as to whether it is needed now can be decided by noting the amount of growth made during the past season.

Manuring should always be looked at from a business standpoint and applications given accordingly, remembering it is not the largest amount of wood, but the greatest number of flower buds or fruit spurs that is wanted; this combined with a moderate yearly wood growth—enough to plainly show that the size of the tree or trees increases yearly.

#### Apple and Pear Trees.

The above remarks apply to apple trees in full bearing and young pear trees. The latter, with few exceptions, are inclined to go too much skyward, with considerable production of smooth, straight rods, if not restricted in their young days. On the other hand, I have seen plenty of miserable starved pear trees that never even had young days or anything else apparently.

But the trees such as I have in mind are those owned by persons who are willing to give a reasonable price for what they want, and also pay in advance for it. If you are willing to do this, now is a good time to make a deposit of manure about the trees that have not come up to the aforesaid requirements.

#### Push on Young Apple Trees.

I believe in pushing young apple trees the first ten years of their life, discriminating of course with regard to situation and the difference in varieties, for no business man will serve Baldwin, Greening, King, like Newtown, Lady Sweet and Spitzenburgh, even when growing side by side.

But I do like to see the side branches reaching out and down, for we see so many of the long-shanked skyward grown trees, that it makes one think they are yet looking for a decent feed.

#### Don't Cover too Early.

In northern sections covering will soon be necessary with all tender kinds. The temptation is to cover too early, at what is often only the first cold snap; overlooking the point that most of the damage is done in early spring by the sharp changing from freezing to thawing. The best covering material is soil, where it can possibly be used.

#### Planting Should Cease.

Planting should now be drawing to a close, and the young planters should fight off the strong temptation to leave the fine young shoots on the newly-planted trees, etc.

#### Cutting Back Newly Set Trees.

There must be no hesitation, but at once cut back the shoots so that the roots will out-balance the tops. Do not now cut so close to the bud, as could be done if planting in the spring, and see that all leading buds point outward and downward.

J. HOLLOWAY, L. I.

#### Plum Burbank.

The suckers mentioned on page 779 are no use; they are offsets from the stock on which the plum is either grafted or budded. Root them out, and throw them away.

The double-flowering peach will not bear fruit. But do not dispose of it. It will probably help cheer you up and make things look brighter when little else is in bloom.—T. H.

Grub up the suckers around the plum tree and consign them to the rubbish pile; they are useless. If allowed to remain around the tree, they will do considerable damage; the strength will be going to the suckers instead of the tree proper.

The double-flowering peach is useless if fruit is the object, but as a flowering shrub in spring, it makes a beautiful picture.—WM. TURNER.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 15, 1894.

PUBLISHED BY

A. T. DE LA MARKE PUBLISHING CO. LTD.

ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.

Telephone, 3154 Cortlandt. P. O. Box 1697.

REGISTERED CABLE ADDRESS  
Commercial Cable) Florer, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 35 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

**Protection** WINTER killing of the fruit buds of the peach of the Peach, is usually due to the unfavorable effects of freezing, after they have been stimulated into growth by warm weather during winter or early spring. It seldom happens in peach districts that the temperature drops sufficiently low to injure dormant peach buds. Peach fruit buds may safely endure a temperature of 10 or 20 degrees below zero, provided they mature well in autumn, are entirely dormant, and the cold comes on gradually. Zero weather may kill fruit buds that have swollen during previous warm days, or that were not properly ripened in autumn. The early swelling and growth of the buds is due to the warmth they receive from the sun on bright days, is practically independent of root action, and may take place on warm, sunny days in winter, while the roots are frozen and dormant.

Shading or whitening peach trees to prevent their absorbing heat on sunny days, opposes growth of the buds, and is, consequently, a protective measure. Whitening the twigs and buds by spraying them with lime whitewash is, on account of its cheapness and beneficial effects, the most promising method of winter protection tried at the Missouri Experiment Station whence a bulletin on this subject has been issued.

These whitened buds remained practi-

cally dormant until April, while unprotected buds swelled perceptibly during warm days late in February, and early in March. Eighty per cent. of the whitened buds passed through the winter safely, while only 20 per cent. of the unwhitened buds escaped winter killing. Whitened buds blossomed three to six days later than unwhitened ones. Thermometers covered with material the color of the peach twigs registered, during bright, sunny weather, from 10 to over 20 degrees higher than thermometers covered with white material of similar texture, thus indicating that whitened peach twigs might be expected to absorb much less heat than those that were not whitened.

The whitewash used was four parts of water, one part of skimmed milk and enough freshly slacked lime to make as thick a wash as could conveniently be pumped through a Bordeaux spray nozzle without clogging. This wash was sprayed on the trees by means of a bucketspray pump. The first application was made the last of December and three subsequent sprayings were necessary to keep the trees thoroughly coated until spring. The cost for material and labor it was calculated is about 10 cents per tree, when done on a small scale.

Shading the trees with canvas hay covers was about as beneficial as whitening, but was more expensive.

"Baling," by drawing the branches together in a vertical bundle and covering them with coarse grass and corn stalks, protects the buds, but old trees with stiff branches cannot well be treated in this manner without injury to the branches.

"Layering," or bending down the trees in autumn and covering them with earth, has proven beneficial. Shading the trees with board sheds, enables peach buds to survive the winter uninjured, when 80 per cent. of unprotected buds are killed. Trees protected in this way blossom later, remain in bloom longer, set more fruit in proportion to the number of apparently perfect flowers, and hold their fruit better than any other trees. This, while the most effective means of winter protection tried at the station above referred to, is probably too expensive for use in commercial orchards.

## A Discussion Club.

There is nothing like asking a question if you want to gain information. In other words, don't follow the tactics of the illustrious Micawber in the search for knowledge. Instead of waiting for the desired information to turn up, do you yourself go out and seek it. How? By sending in your questions to AMERICAN GARDENING.

The Question Box of this paper is the readers' own department. It is indeed a discussion club over the weekly sessions of which the Editor presides. Members of the circle put their desires in writing and send them to the Editor; he prints them and invites other readers to offer replies. But he also does more; he sees to it that the questions are brought before capable authorities, and they will also be handled by the staff of the paper when desirable.

This system makes our Question Box an invaluable medium of exchange of thought among horticulturists and as an educational factor its value is immense.

So far as the conducting of a Question Box is concerned everything depends upon the readers. If they do not make the inquiries no one can answer them.

The more the correspondence received for this department of the paper the more will the Editor be pleased and he will leave no stone unturned in the endeavor to secure an ample reply to an obscure point.

In order to stimulate interest in replying, a weekly prize is offered for the best set of answers received. Who wins next week?

## Coming Events Cast Their Shadows.

In our last issue we announced the preliminary details of the better things to come in early issues of AMERICAN GARDENING and already we are receiving congratulations on what was then published. That is very satisfactory, but we, in our turn, congratulate our circle of readers that they make such things possible.

Special attention of all readers is directed to the offers of cash prizes for photographs and articles, and weekly for the best set of replies to the Question Box detailed elsewhere.

Then think of the special monthly features by which will be combined the activity and interest of a live weekly paper with the solidity and quality of the magazine, yet each distinct and separate.

The regular Literary supplement is an innovation in horticultural journalism, and the weekly treatment of those familiar garden adjuncts, poultry and bees, will be welcome to many. Correspondence and inquiry are invited here as in other branches of the paper's work.

Among other attractive new features for the immediate future we announce:

### Monthly Competition.

Once each Month a Competition on a subject of general interest, and for which suitable money prizes will be awarded.

### Literary Supplement.

Once each Month a Literary Supplement containing full reports of the more important essays and lectures; the special lengthy treatment of some problem; articles of more permanent and scientific interest, etc.

### Presentation Plates.

Once each Month a colored presentation plate, suitable for framing. The twelve sheets which will be given away each year forming a collection which our readers will thoroughly appreciate.

### Cash Prizes for Photographs.

A standing offer of a cash prize for a photograph of a well-grown specimen (flower, fruit, vegetable, or plant) with description as to how the result depicted was attained, from start to finish. Cash prizes will also be paid for photographs illustrating general views, such as groups, landscapes, views, garden scenes, etc.; explanatory matter to accompany all photographs.

### Poultry and Bees.

A column each week devoted to Poultry will be conducted by an acknowledged and well known expert. This should be pleasant news to the many thousands of readers who devote a portion of their time to the poultry yard and moreover the weekly advent of advice and suggestions should be of much value.

The Apiary will be well taken care of, also by an expert. Beekeeping is one of the most profitable of industries, and a legitimate adjunct of gardening.

With these and other contemplated improvements, AMERICAN GARDENING will be the ideal paper for the country home and suburban residence.

## THE QUESTION BOX

He that questioneth much all learn much.—BACON

Readers are invited to forward particulars of any difficulty or perplexity that they have encountered. If the question be one of general interest it will be inserted in this column, so that other readers who may have information to impart can assist their brethren by recounting their own experiences. Questions of a purely individual interest will be replied to by the Editor under the head of "Short Answers."

Questions submitted in this department will receive the full attention of the staff of AMERICAN GARDENING and when desirable will be answered editorially.

All communications for insertion should be clearly and concisely written on one side of the paper only, and addressed to the Editor of AMERICAN GARDENING, P. O. Box 1897, New York City. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query or answer are sent, each should be on a separate piece of paper.

Answers should always bear the title of the query replied to and the page on which it appeared, and our readers will greatly oblige us by advising, as far as their knowledge and observations permit, the correspondents who seek assistance. Conditions, soils, and means vary so infinitely that several answers to the same question may often be very useful, and those who reply would do well to mention the localities in which their experience is gained.

**Important to Querists.**—Correspondents must look through the whole of the paper to see replies to their queries. Answers cannot always be given the week after the queries are received, but there is as little delay as possible in dealing with them.

**Cash Prizes** will be given for the best set of answers each week. Payment to be made monthly.

### Raising English Walnuts.

In the case of English walnuts raised from seed, would not the larger number require to be grafted? I have several hundred young growing trees, procured from nurserymen, mostly preparaturlan; they were doubtless all grown from seed. How do they do in California? Are there male and female among walnuts, as the case with persimmons and grapes? Can not they be distinguished by the leaves? What is the best book you know on this subject?—G. A.

### Book on Medicinal Plants.

Can anyone mention a book (not too large) on the medicinal herbs and roots of this country?—G. A.

### Cutting Tobacco.

Will some one kindly give directions for cutting tobacco, i. e., 1, time to cut, 2, process of curing.—W. C. L., Ont.

### The Stinking Toadstool.

How can I best exterminate what is commonly called the stinking toadstool? Several have come up under our porch and near it. The porch is brick and the earth under it gravelly and sandy. The smell is intolerably offensive. What produces them?—G. L., N. J.

### Habit of Roses.

Are the following Roses tall-growing, or low and spreading? Please state after each its characteristic of growth in this respect: Mrs. John Laing, General Washington, Dinsmore, Mdme. Charles Wood.—S., Pa.

### Greenhouse Heating.

I wish to build a small propagating house 4½x25 feet. One side and one end to the weather. I wish to heat it by putting coil in stove, situated in workshop. Is my plan feasible? Coil would probably be one-inch pipe. What size runs would be best? How much pipe would be necessary? Can I increase from one-inch coil pipe to a larger size?—WM. HANSON.

### Management of Pomegranate.

I bought a pomegranate last autumn from a reliable florist; the moving and re-potting caused it to lose its leaves.

We put it in a greenhouse and all grew again, but the plant has never bloomed. This summer it has stood out-of-doors. Is planted in a wooden box. No frost has touched it, no plant in the garden has been frosted. About a fortnight ago it began to lose its leaves; they turning yellow first, now they are nearly all gone. We brought it inside a week ago. It is a large bush about four years old. What shall I do?—G. L.

### Rosa Rugosa as a Hedge.

How far apart should Rosa rugosa be planted in order to make a mass and wind-break such as was shown in your cut of a Newport garden in issue of August 14.—GEORGE H. BROWN.

### Rose Madam Marie Bianchi.

Where can this be obtained and are the buds of popular shape? I have never seen this variety offered in the catalogues.—E. C., Ga.

### Criticisms of Tomatoes Wanted.

I should like to have some readers tell me something of the merits and demerits of the tomatoes Eclipse and Nicholson Hybrid.—E. C., Ga.

### Planting Raspberries in Fall or Spring.

Is fall-planting of raspberries safer than spring-planting?—H. C. C. M., Conn.

### How to Use Cow Manure.

I should like to know how to treat fresh cow manure or dropping, not mixed with any bedding or litter, so as to make it speedily suitable for plants and bulbs. I have seen it stated not to use cow manure for strawberry growing. Why so?—SAMUEL KEAGY.

### Night Soil.

What book, if any, gives full details as to the preparation of night soil as a manure, and further how to best use it?—WM. E. WHEELLOCK.

### Leaves for Manure.

I should further be pleased to know if fallen leaves can be so treated as to make them turn to leaf-mould, or rot thoroughly, sooner than they do when simply piled and trodden down.—WM. E. WHEELLOCK.

### Pomegranate Does Not Fruit.

I have a Pomegranate, purple seeded! It is six years old and has bloomed well for four years, but sets no fruit. It is a fine thrifty tree 10 feet tall, and by mistake was set near a double flowered scarlet Pomegranate. Would that cause it to drop the fruit with the flower. Here the flowering Pomegranates do not seed.—MARGARET E. CAMPBELL.

### Rose, Bennett's Seedling Rambler.

In a recent issue of your paper we see a description of Bennett's seedling Rambler Rose. I would much like to get one to run on a tree in my garden. Can any one inform me where I can get one and what is the best time to plant it?—SUBSCRIBER, L. I.

### List of Flowering Shrubs Wanted.

I would like to get through AMERICAN GARDENING, a list of flowering shrubs for a private place. They are wanted to flower from April to October, and to be something I can cut from to use in house.—H. J. M., N. Y.

### List of Vines Wanted.

Please give a list of creeping vines to cover piazza posts 15 feet high; creepers to be tied to wire 10 inches wide. They must be hardy to stand out all winter.—H. J. M., N. Y.

### Short Answers.

(To G. A.)—A cold grapery is a house for the cultivation of grape vines without heat.

(To G. H. B.)—As your Violet plants are so close to each other, you will have to remove many of the runners, but do not cut off more than necessary to let in light and air about each plant.

## Universal Satisfaction.

We cannot print all the letters of thanks received from subscribers who now have the Henry strawberry plants—they would take up too much room. But we can take a few specimens, and here they are:

Strawberry plants were received last night and are far beyond my expectations; they are splendid; as good as pot-layered plants. The packing was first class; they arrived in very fine condition. I for one am thoroughly satisfied, and thank you very kindly for your trouble.—JAMES DUTHIE, L. I.

Confirming your postal of November 1, I wish to say that the plants arrived in good condition and were well packed. I am delighted with them; they are all that we could desire, and we appreciate your kindness in taking such special care with them. Our next club order will probably be for spring plants.—WM. SYER, Ont.

I was glad to receive a superlatively done up package of Henry plants. Upon undoing I was surprised at beholding the finest plants and in the best shape for setting and living of any plants I ever received by mail or express, not excepting the potted, and I have received plants from all the leading strawberry shippers.

I have the highest interest in your berry and shall take every pains to make it the top of the heap for this county, if not Michigan, as I believe it capable of being.

I take a great interest in your series of articles, to read, learn, and practice, as I am not only a hard strawberry worker, but reader, thinker, observer, and a small writer.

I have set out the plants. I spent two hours in fixing ground. I have them in a frame I had. The ground was rich. Space used 3x9 feet. First, rich and fine manure dirt, wheelbarrow full, tin pall full of sifted ashes, and one of lime mixed with wheelbarrow full of fine muck. All mixed and made fine with spading the ground with spading-fork. Raked and tramped firm. Last night trimmed large leaves off, wet roots, laid out in wet moss in basket. Made puddle of rich dirt, muck and sand, with warm water, dipped roots in, made hole in ground, poured cup of water in, held plant in, sifting fine moist dirt in, pressed slightly till water settled, shaded with boards. I set two runners to increase stock. Expect to send a number of subscriptions to get more plants to propagate from and get ready to have a patch out next fall that will surprise the county.—J. M. C., Mich.

My Henry strawberry plants came while I was in Ocean Grove, N. J., and were here a full week before I could put them out; the leaves were dry and brittle. New leaves are starting, so think they will grow. Please send me Mr. Jerolaman's articles in pamphlet form.—T. B., N. Y.

[No doubt about growing; they are strong plants and well packed.—ED.]

The Henry plants came by express in splendid shape, not a leaf wilted, for which please accept my thanks.—GA.

I have had eleven men for the past two days setting out plants of Henry and Mary in a new bed for my own use in order to show all growers what may be done in strawberry culture by setting plants out the last of October. Will wager \$1000 with any one that it will by June next outyield any bed of its size (in the United States) that was set out this spring.—Letter from H. Jerolaman, October 26, '97.

I have taken your paper for the past two years, and for practical information for the professional or amateur gardener, I am convinced it is the paper.—JOSEPH WOOD, gardener to J. M. Wallis, Esq., General Superintendent Penna. R. R.

The above are spontaneous communications and show that the premiums given are really all we claim for them.

## The Bee Keeper.

### Some Elements of Successful Wintering.

This is a problem that has been apparently solved over and over again, but new factors appear and old ones under new conditions bob up, so that there ever remains much uncertainty about it.

A great deal has been learned, though by costly experience, and now we are in such a position that we may feel reasonably sure of safely bringing over the winter a very large percentage of our bees if properly put into winter quarters. There are a few rules we must carefully observe if we would make a success.

#### Strong Colonies.

First, we must have a good strong colony of bees, a fair proportion of them being young, as the old bees who helped to store the fall crop of honey are worn out and dwindle away during the earlier part of the winter, and if there is not a good supply of bees hatched during September and October, the colony will be too weak by January or February to withstand the cold and will succumb, or if it get over the winter, it will be so depleted that it requires most of the season to build up and will be worth little or nothing for storing honey.

#### A Prolific Young Queen.

The bees should of course have a good prolific queen not too old, say not more than two years. If the queen is old and worn out she often dies during the winter, and a queenless colony in the early spring is not desirable, as queens are not readily procured and not easily introduced. A good prolific queen is an absolute necessity early in the spring if we would make a profit out of the colony that season.

#### Good Food Supply.

The next important item is the food supply. You may have the bees and queen, but if the colony lacks food or the quality of the food is bad you cannot expect to successfully carry it through the winter. A strong colony of bees should not have less than 30 pounds of good food, and in the cold Northern states, 40 pounds is none too much. Remember the queen should start laying in the forepart of February and when breeding starts, much honey is required both to keep up the proper temperature and to feed the young brood. If the food is scarce breeding is delayed and often the colony is late in building up and the honey harvest will be well advanced before the colony is ready to store. Thus a saving of 25c. in the fall may mean a loss of one or two dollars next spring.

If the colony does not have sufficient stores it should be fed early in the season so the bees can cap over the stores. It is almost too late now, but better late than never. I have fed colonies in November during warm spells giving the syrup warm and if necessary have placed a warm brick or two on the feeder, and the bees generally did well, though I don't advise this unless there is no other remedy.

Well-ripened sealed honey is no doubt about the ideal food of the bee, but syrup made from granulated sugar answers the same purpose, and is much cheaper for the apiarist. I always use sugar syrup for feeding for winter stores.

#### Making Syrup.

I prepare it as follows: I use a cylindrical tin vessel holding 100 or more pounds, with an outlet at the bottom. I have my tinman make to fit in the vessel a circular bottom of galvanized wire netting, one-eighth of an inch mesh fastened to a galvanized iron hoop braced with a few cross wires. This false bottom I drop down and the hoop rests on the can bottom and leaves a one-inch space between.

On this I spread a cotton cloth and put a good quantity of sugar on it. I now pour cold water on the sugar which slowly percolates through and takes up all it can hold, and when it drains out of the can into another vessel it is ready to feed. The above described can I use also to hold and drain the capping while extracting. It is the ideal for that purpose.

#### A Warm Dry Hive.

The next requisite for successful wintering is a good hive, one that will keep the bees warm and dry, not necessarily a large lumbering double-walled chaff packed hive, though chaff hives have their advantages, but the disadvantages often overbalance the advantages. I prefer the single-wall hive, and in this latitude they give general satisfaction. In the cold North, cellar wintering is generally practised.

#### To resume now:

1. Strong colonies of vigorous bees.
2. A prolific young queen.
3. A plentiful supply of good food.
4. A good hive to protect them from the elements.

#### Hints for the Novice.

There are some minor items I might mention for the benefit of the novice:

Don't disturb or manipulate the bees during the cold season.

Keep the entrance at the bottom of the hive open and unobstructed for ventilation.

Bees consume oxygen and throw off carbon dioxide as all air breathing beings do, and proper ventilation is necessary.

Remember the hive with its warmth makes an excellent harbor for mice, and they like honey too, so you want to construct your entrances to exclude the mice.

Have no upward ventilation, as that will carry off the heat generated by the bees, and is injurious.

If the entrance is kept clear and unobstructed  $\frac{3}{4}$  by 5 or 6 inches they will get all the fresh air they need, and the air will change slowly in the hive, so as not to chill the bees. When the bees are in a cluster during cold weather the dead bees drop to the bottom of the hive, remove them.

L. W. LIGHTY, Pa.

## The Poultry Yard.

### Wants Lice.

A man has at last appeared who wants poultry lice! He does not seem to have lost his senses, but rather to be in the way to exercise them more fully, since he wants the lice for experiment. Farm Poultry has employed him to conduct some experiments looking toward accurate information about poultry lice. Some poultry keepers don't want any more accurate information concerning the lice; they know they are on hand, that is enough! The knowledge desired is how to get rid of the lice, and this is, of course, the end in view with the proposed experiments.

### Liquid Lice Destroyer.

(One can scarcely remember the names of all the brands of this necessity that have lately been placed upon the market. Dr. Wood has made public a formula costing 35c. a gallon, to put together. It consists of one pound naphtha camphor dissolved in one gallon of kerosene. This is to be painted on the floors of roost or house open on one side for admission of air. Or, it can be painted on the inside bottom of a box, in which the bird is to be confined by covering her with a basket also painted inside. The fowl is to remain thus enclosed half an hour or more. Some have complained of resulting injury to the birds, but it is strongly insisted that none results if directions are followed. The bird must not be deprived of all air.

### Cut Clover for the Flocks.

When on range, there is perhaps not another food that fowls and chicks will eat with so much apparent relish as clover. It would seem that here is the strongest possible pointer towards their needs and likings; when we are getting ready for winter. Strange to say, the art of man has not yet found a way to make the cured clover fully palatable to the birds. The greenest, sweetest of cured clover lacks by much, the charm of the fresh, green, easily-cropped herbage. Yet, as clover, together with wheat, forms an almost rightly balanced egg ration, we must coax the laying stock to

eat it rather freely. This is best done by mixing with it the soft feed which they like best. We consider cabbage about equally good; the hens consider it better than dried clover.

### A Novelty Clover Meal.

There has lately been put upon the market a new poultry supply, in the shape of ground clover, and called Pioneer Clover Meal. It is to be sold at the same prices as cut, dried clover, and the points of superiority claimed are ease of handling, and economy through the fact that there is no waste. It seems worth a trial at least, as there are always some points of complaint about cut clover, indispensable as it has been considered.

### Soft, or Hard Feed.

Strong differences of opinion exist among poultrymen at large, as to the comparative value of soft feed, and grains for regular feeding. The majority doubtless feed a ground mess at least once a day throughout the winter, and some continue it throughout the year. It seems to be nearly a necessity, if only as a medium for mixing cut clover and ground meat, if the latter be dry. Some use all soft feed; these are few. A few others plant themselves firmly against soft feed of every sort, believing it to be a detriment to the flocks. And it is no stranger, perhaps, in connection with this than with many another difference, that each thinks he is borne out in his ideas by his experience. A late contribution from an expert seems to throw some light on the difficulty. He affirms that soft feeds, on the whole, tend to free egg production, while tending also in the long run, to induce disease. It is eggs at the expense of the hens. A point not to be forgotten is that soft feed costs less than hard grain.

### Showing Dressed Poultry.

Samuel Cushman contributes a prod to use upon the utility men who deny their debt to the fancy, by charging that they have never yet supported the shows to the extent of exhibiting dressed poultry enough to make this department a success. This is his exhortation: "Practical raisers and utility men, if you are anything but beneficiaries of the fanners' shows and the breeders' work, if you do not always receive and never give, if you have enterprise or public spirit, show it by supporting the practical department of the Boston poultry show." This might apply equally to any show offering a chance in practical lines. Boston has made extra efforts in this direction.

M. V. N.

### The Strawberry-Raspberry.

In a late floral advertising monthly I notice an illustration of this new berry. Last winter I bought two plants and they were small plants too. They grew and grew like the famous "turpie." There were a few flowers not as large as Roses unless the old Playune Rose. I could never find any fruit, now September 12. I know the mass of plants is knee deep and about seven feet across. The question is what to do with them? I have little room to spare experimenting, still I do not like to give up a thing before giving it a fair trial. I had the Japanese Wineberry six years and at last had to dig it up and throw it away; it never fruited, would not grow in bush shape, just long vines that would climb over the supports and touch the ground making mere worthless plants.—MARGARET E. CAMPBELL, Louisiana.

—What the so-called "Strawberry-Raspberry" is good for we have not been able to discover, it suckers dreadfully and close attention alone will eradicate it now. The Japan Wineberry gives much satisfaction in some places—the climate seems to influence it.—Ed.

The Reliable Incubator & Brooder Co. of Quincy, Ill., has received official notice that it has captured the highest award on incubators and brooders at the Brussels, Belgium, International Exposition. This is the bronze medal and diploma.

## PRIVATE GARDENERS.

## Appointments and Doings.

Gardeners and others knowing of recent appointments and movings are requested to forward particulars of the same for publication in this column. No charge is made.

## New York.

The New York Gardeners' Society gave a floral exhibition for charitable purposes in the Waldorf-Astoria Hotel Friday, Saturday, and Sunday last. Never was an exhibition staged in more palatial surroundings and the many groups of decorative plants together with fine specimens showed up well and produced an enchanting and fine pictorial effect. In the center of the room stood a plant of *Kentia Forsteriana*, 18 feet in height, exhibited by R. Brett, gardener to J. B. Colgate, Yonkers, N. Y. This same exhibitor also had other Palms, huge Crotons, Ferns and Cycas, scattered about. Crotons were also exhibited in fine condition and color by Charles Webber, gardener to Mrs. J. H. Hood-Wright, Fort Washington, N. Y. This same exhibitor also arranged a fine circular group on the main floor. Charles Knight, gardener to E. R. Ladew, Glen Cove, and W. Duckham, gardener to D. Willis James, Madison, N. J., were also large contributors.

For the best-arranged group covering space of 100 square feet, Charles Knight, gardener to E. R. Ladew, led with a remarkable arrangement, winning purely by reason of the superb and artistic grouping, entirely devoid of all conventionality. It was a masterpiece, and in surprising contrast to the same exhibitor's work in class 2, calling for a collection of plants covering 75 square feet. Indeed had it not been for the namecards one could not have credited to the same individual two such extremes of good and bad work.

R. Brett, gardener to J. B. Colgate, staged the second prize group in the former class with some very fine plants, including one of the grandest *Kentias*. It is possible to find; also a grand Croton and many other choice plants. Charles Weber, gardener to Mrs. J. Hood-Wright, was awarded a certificate of merit for a good group in the same class.

In the class calling for "the best collection" of stove and greenhouse plants, to cover 75 square feet of space, there were three competitors—W. Duckham, gardener to D. Willis James; R. Brett, and Charles Knight. Mr. Duckham's display was very remarkable for richness, value, rarity, and variety; the grouping was very artistic too. To mention a few of the features there were: *Calamus cinnamomeus* (rare), *Maranta Sanderiana*, well grown, and the only specimen in the country. The leaf is broadly ovate,  $13\frac{1}{2} \times 8\frac{1}{2}$  inches, very striking; the reverse is a dark purple; the superior surface very deep green, shiny, with paler mid-rib, each half of the leaf bearing numerous clear, transverse white lines (running parallel with the venation) leaving the clear green ground one inch wide near the mid-rib and one inch on the margin. Continuing the selection we must name *Zamia gracilis*, *Licuala elegans*, (Croton Reedl) (very fine), *Rex Begonia New Beauty*; *Dracena Sanderiana* with 10 growths, *Dracena The Curtiss* (magnificent), *D. Goldiana*, *Calamus assus*, showing a young frond of light brown; *Chameros humilis*, well furnished; *Demonorops* sp., *Ludovia atrovirens*, and *Myriolepis schottiana*. The crown of the group was made by a specimen *Cocos Bonetti*, the only plant in America. Other plants were used for filling; there were in all 61 distinctive features. The award of the judges in this class was simply astounding; the above rich "collection" was placed second, the premier award going to a far poorer collection embracing only 31 distinctive features; the plants in it were more ordinary, of the usual greenhouse type, and not all in show condition, though larger. There were *Maranta zebrina*, two large Crotons, two *Ixoras*, *Nepenthes picturata*, well pitched (50 in all),

and *N. Mastersi*; a good piece was a splendid plant of *Acanthopanax crinita* in the center. Plainly the judges made their decision on the size of the plants; and they either did not realize the value and rarity of the components of Mr. Duckham's exhibit, or misinterpreted the demand of the schedule in calling for the best collection.

Orchids formed the richest part of the whole exhibition and it is doubtful whether such a unique and valuable collection was ever before displayed at any American flower show.

For C. G. Roebling, Esq., of Trenton, his grower, Henry Clinkaberry, made a display that more than covered both with glory and afforded the public a rare chance to see some of the gems. In the two winning lots whereby a silver cup and silver medal were gained, there were *Cypripedium Spicerianum*, 10 flowers; *C. insignis Couleoni*, one flower; *C. Charlesworthi*, six flowers, a fine type; *C. Henry Graves, Jr.*, one flower; *C. Arthurianum pulchellum*, eight flowers; *C. Thayerianum*, four flowers; *C. regale purpureum*, five flowers; and some 22 others. Most noticeable, however, was the rare, pale green *C. insignis Sanderiana*, with one expanded bloom and two buds borne on a marvelously healthy and vigorous plant.

There were also *Vanda Sanderiana*, *V. suavis*, and the beautiful, rare *Arides Lawrencei*.

Max Nathan, Hastings, N. Y., (gardener, R. Ashley), made a good display of *Anthuriums*, *Vanda cœrulea* and *Phalenopsis*. For the best specimen plant, A. Herrington was first with *Cattleya labiata* in a 24-inch pan and bearing 90 blooms. This same exhibitor also secured a first for group of Orchids in the commercial class with a group of *Cattleya labiata* and *Cypripedium insignis*.

Lager & Hurrell made an interesting display of *Cattleyas* and *Oncidiums*, while W. A. Manda had a charming mantel decoration, mainly *Oncidiums*. He also showed fancy *Caladiums*.

The average of the cut blooms of *Chrysanthemums* was poor, although the quantity was great. Space will allow only mention of the most striking contributions; Vivian-Morel and Niveus from Peter Duff; Golden Wedding from W. C. Russell; Cullingfordii from G. B. Winslade. In the collections this last-named made a complete show, representing all sections. Other prize takers were Peter Duff, W. Scott, W. C. Russell, S. A. Leuba, and T. Harvey.

The principal prize winners for Roses and Carnations were: W. Turner, A. A. Taaffe, A. G. Wengert, Owen G. Owen, and W. Cowan. J. M. Hunter was first for *Gardenias*, F. R. Pierkovsky for single *Violets*, W. Duckham for doubles. W. Boyle showed *Rosa virens*, *R. polyantha Midget*, and blooms of *Helleborus niger*.

There was a good showing of grapes, W. Scott being first for two bunches of black with *Barbarossa*, and Robert Jones, gardener to S. Peters, Islip, second with *Gros Colmar*. W. Scott was again first for four bunches. G. B. Winslade for two bunches of white. Ellwanger & Barry, Rochester, made a large contribution of choice pears.

Other exhibitors were W. Anderson, gardener to F. E. Constable; Peter Duff, gardener to J. Crosby Brown; W. C. Russell, gardener to C. F. Dieterich, Millbrook, N. Y.; James Dowlen, gardener to Gen. H. L. Terrell; A. L. Marshall, gardener to J. B. Dutcher, Pawling; Robert Whyte, gardener to Mr. Graeffe; Robert Angus, gardener to Major R. E. Hopkins, and among trade exhibitors F. R. Pierson Co., Siebrecht & Son, John Scott, Charles Trauth, John Lewis Childs, C. W. Ward, Queens, L. I., and A. Herrington.

## Hartford, Conn.

The Chrysanthemum Exhibition of the Connecticut Horticultural Society was held in the Putnam Phalanx Hall on November 9, 10 and 11.

One of the most noticeable features of the show was the large number of bush plants, some of them six feet in height and carrying as many as 50 large sized

## A MUSICAL EDUCATION Without a Teacher

Price, 75c., Complete.

THE instruction books known as Winner's Eureka Methods are intended for pupils living at a distance from a teacher, or for those who cannot conveniently employ one. They do for the pupil exactly what a teacher would do, and in an equal length of time. Thousands of people owe the enjoyment of playing a musical instrument wholly to the excellent course of instruction found in these books. Beginning with the first rudiments of the subject, the pupil is led, step by step, by means of simple and direct explanations, illustrations and progressive exercises, to a complete mastery of the instrument desired. Besides the instruction pages, each volume contains nearly a hundred carefully chosen pieces for the instrument of which it treats. This alone would cost from \$2 to \$3, if purchased separately.

**FOR ANY OF THE FOLLOWING INSTRUMENTS**

ORGAN, PIANO, CLARINET, VIOLIN, FLUTE, BANJO, GUITAR, VIOLA, CELLO, MANDOLIN, ZITHER, CORNET, PICCOLO, ACCORDEON, FLAGEOLET, DOUBLE BASS.

EACH BOOK 75c. COMPLETE, Postpaid.

When ordering, mention the instrument for which the book is wanted.

BOOK OF  
EUGENE  
FIELD'S  
POEMS**

To each person interested in subscribing to the Eugene Field Monument Souvenir Fund. Subscriptions as low as \$1.00 will entitle the donor to this handsome volume (cloth bound, size 8 x 11) as a souvenir certificate of subscription to the fund toward building a monument to the Beloved Poet of Childhood. But for the noble contributions of the world's greatest artists this book could not have been manufactured for less than \$7.00. Address: **EUGENE FIELD MONUMENT SOUVENIR FUND**, 412 Fort Dearborn Building, Chicago, Ill.

## Raise Hens

People living just outside cities and large towns can (owing to their nearness to markets) make large profits in the poultry business. No other occupation pays better or is easier to conduct. It can be successfully carried on by women or boys and girls, provided they have a knowledge of the right methods of management, feeding, etc. This may easily be gained by faithful study of that best and most practical poultry paper,

## Farm-Poultry

It teaches how to make money raising poultry and eggs for market. It is edited by practical poultry raisers, who tell their readers how to prevent and cure all poultry diseases; bring pullets to early laying maturity; make hens lay when prices are highest; build the best houses and yards; keep poultry free from vermin; hatch strong chickens in incubators; caponize and dress poultry for market. Published semi-monthly.

Price, \$1.00 a year; 50 cents for six months. Sample copy and a 25c. book, "A Living from Poultry," sent for 12c. in stamps.  
**I. S. JOHNSON & CO.,**  
Custom House St., BOSTON, MASS.

blooms. Another point worthy of notice was the unique success of Thomas Dryden, an amateur grower, who succeeded in gaining six first prizes and two seconds, all for plants in 10, 12, or 14 inch pots.

In the class calling for 15 distinct named plants, that exhibitor was first with Mrs. A. J. Drexel, Niveus, Miss G. Pitcher, Col. W. B. Smith, Mrs. Henry Robinson, Eda Frass, Queen, C. B. Whitnall, Vivland-Morel, W. Lincoln, Mrs. R. Craig, Mrs. G. Morgan, J. Collings, Mrs. W. P. Raymer, and Etoile de Lyon. James Smith, gardener to Miss E. Case, was second with 15 plants almost equal to Mr. Dryden's.

For four white distinct plants and four pink this order was reversed, but Mr. Dryden led again for four plants yellow and also for specimen Chinese and Japanese. Mr. Dryden's Niveus (Japanese) was six feet in height and carried about 86 good-sized blooms, while his Miss Georgiana Pitcher had 52 blooms, although some were a little past.

For specimen Pompon, J. Smith was first and Gustave Minge, gardener to M. G. Buckley, second.

In the class for three standards T. Dryden was the only exhibitor, but his plants were well worth the notice they received. They were Mrs. A. J. Drexel, Etoile de Lyon and Col. W. B. Smith. Etoile de Lyon was easily voted the prettiest plant on exhibition.

For 10 specimen blooms on single stems in six-inch pots, Stephen Delbar staged a magnificent collection. His varieties were Sybil Kaye, Mayflower, Etoile de Lyon, Golden Wedding, Miss M. Wanamaker, Mrs. Jerome Jones, W. Lincoln, Mrs. Henry Robinson, Mrs. C. B. Freeman, and Mrs. Perrin. J. Smith was second, also taking first for six similar plants. A. N. Pierson, Cromwell, Conn., S. Delbar, John Coombs, and George S. Osborn were prize winners. W. B. May, gardener to J. J. Goodwin, exhibited 20 naturally-grown sprays and also seedling blooms.

For vases of 12 yellow, 12 pink, and 12 red, A. N. Pierson was first with Miss G. Pitcher, Maud Dean, and Cullingford, respectively, and for a vase of white Geo. S. Osborn was first with the Queen.

### Newport, R. I.

At the regular meeting of the Newport Horticultural Society held on November 10, there was a large attendance to listen to a paper on "The Chrysanthemum," by Mr. Arthur Griffen, gardener for J. J. Van Alen, Esq. The writer gave full instructions for the propagation and after culture of this popular flower, according to the present methods. He recommended pot culture as the most suitable for amateurs, the sizes being 8 or 10, the number of flowers to the plant to be left to the fancy of the individual grower. He advised the use of Clay's fertilizer.

At the business session seventeen new members were received, and two proposed for the sustaining membership, to be voted for at the next meeting. There was quite a large display of Chrysanthemums, and other flowers around the hall. The principal awards were to Mr.

### \$100 Reward, \$100.

The readers of this paper will be pleased to learn that there is at least one dreaded disease that science has been able to cure in all its stages and that is Catarrh. Hall's Catarrh Cure is the only positive cure now known to the medical fraternity. Catarrh being a constitutional disease, requires a constitutional treatment. Hall's Catarrh Cure is taken internally, acting directly upon the blood and mucous surfaces of the system, thereby destroying the foundation of the disease, and giving the patient strength by building up the constitution and assisting nature in doing its work. The proprietors have so much faith in its curative powers, that they offer One Hundred Dollars for any case that it fails to cure. Send for list of testimonials.

Address, **F. J. CHENEY & CO.,**

Toledo, O.

Sold by Druggists, 75c.

Arthur Griffen for new and improved forms of Begonia semperflorens in several colors, silver medal. To Alex. MacLellan for yellow seedling Chrysanthemum Mrs. John R. Drexel, bronze medal. To Mr. Robert Laurie for two vases of Chrysanthemum blooms, perfect specimens, certificates of merit. To Mr. Andrew S. Melkie for vase of Calanthes, in variety, certificate of merit.

At the next meeting on November 24, the Question Box is expected to furnish material for discussion.

Nasturtium, Heliotrope and such like are still blooming in the open air here. What a fine thing the annual Wall Flower is! It blooms freely in the summer with a second crop in the fall, and is equally as fragrant as the old-fashioned biennial. Cosmos has been extra fine, but was very late in blooming, caused no doubt, by the wet season.—A. MacL.

### Millbrook, N. Y., Show.

Through the energy of two growers who are liberally aided and encouraged by their employers, Mr. Samuel Thorn and Mr. C. F. Dieterich, Millbrook has established for itself a name among Chrysanthemum growers. Among those competing on November 9 and 10, and who captured most of the prizes were W. C. Russell, gardener to C. F. Dieterich; I. L. Powell, gardener to Samuel Thorn; Gustave Thommen, gardener to Mr. J. D. Wing; Charles Rapp, gardener to Mr. Oakley Thorn; James Blair, gardener to Mr. D. O. Mills, Staatsburg; Thos. Harrison, gardener to Hon. Levi P. Morton, Rhinecliff; Wood Bros. Fishkill, and Thos. Devoy & Son, Poughkeepsie.

In the classes for cut blooms the principal struggle was between the two first-named gardeners. No keener competition ever existed than this, for when one of these contestants defeats the other it is only by the smallest margin, and then the one defeated would be equal to winning outright in almost any other exhibition.

Bush plants are always a feature of this exhibition, and were in a few cases better than usual. W. C. Russell's specimen plant of W. H. Lincoln put up for the best yellow, was perfect in contour, the lower tier being brought down low to entirely cover the pot; it was a perfect picture. The flowers, 210 in number, were of uniform size and finish and nearly up to exhibition standard. I. L. Powell was second. For the best pink, Mr. Russell was first with a grand plant of Vivland-Morel, and in the class calling for the best three, led with three grand plants—W. H. Lincoln, Puritan and Ivory. Mr. Powell being a no mean second with the same varieties.

For the best standard Mr. Powell was first with W. H. Lincoln.

For the best plant in the show Mr. Russell was first with W. H. Lincoln, about seven feet through.

The competition for 12 blooms distinct, with long stems, brought out four competitors. Mr. Russell secured the award with Mayflower, Major Bonaffon, Mutual Friend, Golden Wedding, Mrs. Jerome Jones, Inter-Ocean, H. W. Rieman, Minerva, Erminilda, Niveus, Mrs. Peabody, and Vivland-Morel.

In yellow, first W. C. Russell, with Golden Wedding. In white, I. L. Powell was first with five heavy blooms of Niveus and one bloom of Mrs. H. Weeks. For six pink, Vivland-Morel, with enormous blooms, from Mr. Russell, were victorious. For six crimson Mr. Russell scored with W. Seward. In six any color W. C. Russell was first with Mrs. Jerome Jones. For the best single bloom Mr. Russell won with a Mrs. Peabody, 27½ inches in circumference. In 25 blooms to a vase, one variety, Mr. Russell was strong with a marvelous vase of Golden Wedding; but Mr. Powell's vase of Minerva was so thoroughly good that the judges divided the honors.

For a vase of Chrysanthemums arranged with other foliage for effect, Gustave Thommen was first with a charming arrangement of Berberis Thunbergii, Ampelopsis, and Niveus blooms. In the collection of cut blooms not less than three varieties, six blooms of each, in

## DO YOU NEED WATCHING?

Or, to put it another way,

### Do You Need a Watch?

We sell them, sell them at such an exceedingly low price that you can't afford to go watchless.

Got 'em all sizes and styles.

But we'll just mention two:

An Eight or Waltham Watch, best movement made, hunting case, accurate time-keeper, handsomely engraved, Drexler Case, heavily gold-plated—last for all time. Ladies' or gentleman's size.

We'll send it to your address with privilege of examination. If it's not entirely as represented, send it back—costs you nothing. If you like it, pay the agent express charges and \$6.50. —That's fair. Or this—

A Hunting Case Watch—beautifully engraved case, first-class movement, any size, heavily plated (14k)—looks just like a \$40.00 gold watch—keeps as good time as any of them. Sent to your express agent with privilege of examination—same conditions as all our watches sent out—and if you like it, pay him \$6.45 and express charges.

If you take our word for it, and send money with order, a handsome chain goes with either, and express charges are paid by us, for the prices named above.

### Indianapolis Flower Show.

The eleventh annual Chrysanthemum show opened on November 2, in Tomlinson Hall.

There were numerous entries for these in the different colors, the awards going to Geo. W. Childs, H. L. Sunderbruch, Mrs. Robinson, T. B. More, Thanksgiving, Solar Queen, Longfellow, The Barrington, Golden Wedding, Mrs. Farsdon, Nyansa, Ivory, and Domination.

In the contest for 15 varieties, three blooms each, Nathan Smith & Co. were first, and Hill & Co. second. These two collections gave the judges a good deal of trouble as to which should receive the award. As an index of the character of the blooms the following varieties in the two sections were shown: Smith's varieties—Philadelphia, Mrs. Robinsons, Col. Smith, Georgiana Pitcher, M. Wasmaker, Mrs. G. Morgan, H. L. Sunderbruch, Ed. Hatch, The Queen, Geo. W. Childs, Mrs. Twombly, Charles Davis, Australian Gold, Tahib Bey, and Mutual Friend, with two exceptions, all standard varieties, some of them quite old ones, of deep build, with yellow and light colors predominating.

The most striking in the second prize lot were Evangeline, Mme. Carnot, The Barrington, Mme. G. Henry, Lawn Tennis, Mrs. Peabody, Western Pride, Golden Harvest, and Duchess of Fife.

Henry Rieman, of Indianapolis, was first on cut blooms, ten varieties, three of a kind. These were very fine. The Queen, Modesto, Lady Playfair, Vivian-Morel, Mrs. Geo. West were among the varieties that for this entry won first place.

In the class for 25 pink, Bertermann Co. were first with Mrs. Perrin.

In the class for vase of 25 yellows, Bertermann Co. were first with Major Bonnaffon.

For 25 blooms, bronze, Hill & Co. won with Mongolian Prince.

For vase of 25 white, Hill & Co. received first award for the English novelty Mrs. H. Weeks.

For best 10 white blooms, Chas. Wheatcraft won first premium with Mrs. Robinson; best 10 yellow, Weber & Son with Modesto; best 10 pink, Theo. Bock with Mrs. Perrin; best 10 red, Nathan Smith with G. W. Childs. In this class Stollery Bros. were second with magnificent Mrs. Drexel, immense in size and depth.

Hill & Co. were first with best 25 novelties, introductions of 1897; also on collection of pompons; among them were lovely examples of Elise Dordan, Black Douglas, Cedo Nulli in its three colors, Marie Stuart, the pompon anemone Jersey Beauty, etc.

Hugh Graham, Philadelphia, was awarded a certificate for chrysanthemum Pennsylvania, a bright yellow sport from Philadelphia, identical in every point with that variety save color.

### Germantown, Pa. Show.

The fruit and flower show of the Germantown Horticultural Society held in the Y. M. C. A. hall, November 3 and 4, was voted the best ever given by the Society. Chrysanthemums did not monopolize the show, being rather in the minority. This feature was considered by the public as an excellent innovation. Fronting the entrance was a decoration of about 150 feet of floor space of palms, crotons, dracenas and chrysanthemums by Wm. Berger. The stage was entirely hidden by large palms, the work of Albert Woltemate. In front of the stage were two decorations, of 75 square feet each, and the north corner of the same extent. These were by Woltemate, Herbert Cliffe, and John Welsh Young, and were entered in competition, the judging being done by three prominent ladies of the town. The premier award went to Mr. Young, Mr. Woltemate being second.

The exhibit of Chrysanthemum plants was disappointing, the majority of those who entered claiming their inability to get the blooms sufficiently far forward so as to have the plants good enough for show purposes.

The display of cut blooms was very

fine, the new sport Pennsylvania, a very fine yellow shown by Hugh Graham taking the honors. The 12 blooms of this variety shown by this firm averaged 5 1/4 inches in diameter, both in height and breadth making them perfect globes.

The premier awards in Chrysanthemums were secured by John F. Sibson, gardener to Thomas McKean, both in plants and cut blooms.

#### Chicago Flower Show.

The seventh annual flower show of the Chicago Horticultural Society opened on November 9.

There was a unique exhibit of grafted Chrysanthemums grown by Robert Mueller, gardener to Mr. A. S. Trude, one of which had 14 kinds all well in flower—L. Boehmer, Mutual Friend, Mrs. Bunn, Jessica, Modesto, Morel, The Bard, Mayflower, Mme. F. Perrin, Dean Hole, G. W. Childs, Ninevah, Golden Hair, and Golden Wedding. Another contained six, and still another, seven kinds.

In standards John Reardon, gardener to M. A. Ryerson, Esq., staged Dean Hole, six feet through and loaded with flowers; Mutual Friend grafted on President Smith, very fine; Georgiana Pitcher, six feet, with over 800 blooms, and a 12-inch stem; also a Sunrise, a mass of flowers.

W. N. Rudd had a yellow sport of Mayflower, seven feet high, a beauty. A pair from Crabb & Hunter, Grand Rapids, Mich., were also fine. W. N. Rudd also had a seven-foot Mayflower, well done, and J. C. Vaughan a Miss Georgiana Pitcher, very neat.

In bush plants, John Reardon's Boehmer was six feet through, and three feet above pot, a mass of flowers; The Bard, magnificently done, and a pair of yellows six feet, one of Georgiana Pitcher with over 350 flowers, evenly distributed; a five-foot Ivory, also a six foot Mutual Friend. W. N. Rudd's plant of the same variety was four-foot through; he also had a Chebeague with very large flowers grown quite dwarf. An English variety, Duchess of York—a mass of gold tassels—and W. H. Lincoln, finely done. A. McAdam staged good 10-inch plants including The Bard, Mrs. J. G. Glessner, Mutual Friend, Dean Hole, and Mrs. Perrin.

Of single-stems there were but seven groups, all of dwarf growth. Mr. McAdam had Morel; J. C. Vaughan two groups, one of white, another of yellow; Crabb & Hunter three groups—Robinson, Mrs. Perrin, and Bonnafon.

It took 725 vases to stage the aggregation of cut flowers, and certainly for size and build of blooms this city has never seen their equal. W. N. Rudd took first for best 40 blooms white, yellow, pink, and any other color; best 20, one bloom each; 12, one bloom each, and six in white and yellow, being stopped only by a Highland Park grower in class 9, six blooms pink, with Vivand-Morel.

Picked from among the mass of exhibits for size or general high grade, we name the following: Le Colosse Grenoble, a broad, flat, whitish pink; Vt. de Chazelles, bronze-yellow; Maud Dean, pink; M. H. Jones, a curled pink; Modesto, simply grand; Vivand-Morel, Mayflower, Golden Wedding, Mrs. J. G. Glessner, Iora, The Queen, Oakland, Zulinda, Chas. Davis, Autumn Glory, Brazil, yellow; Mrs. Higginbotham, hairy pink; Golden Gate, Silver Cloud, Mme. Carnot, a curiously formed whorled white; Mrs. G. M. Pullman, W. S. Davis, Mrs. Peabody, Mrs. Geo. West, Mrs. Robinson, Chebeague, Mrs. H. Weeks, a perfect white; Evangeline, Mrs. M. A. Ryerson, Nyanza, an incurved broad petaled Jap.; Sunstone, light yellow; Boule d'Or, Western King, fine; E. Dailledouze, Jennie Falconer, Liberty, Lenawee, Simplicity, and Mrs. Harry Toler.

E. G. Uhllein's gardener had again a table of cut Orchids and another of plants finely in flower.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

BY WILLIAM TRICKER.

PRICE, \$2.00. 25 per cent. off to subscribers to American Gardening and Florists' Exchange.

This work contains nine beautiful plates, eighteen full page descriptive views of leading Water Gardens and Ponds, and numerous smaller pictures prepared with special reference to this work. On heavy enamelled paper. Elegantly bound. Large octavo.

The text describes all operations from the growing of plants in tubs to the large water garden, excavation of grounds, construction of ponds, adapting natural streams, planting, hybridizing, seed saving, propagation, the aquatic house, wintering, correct designing and planting of banks and margins, and all other necessary details.

# WHOLESALE MARKET REPORT.

## New York.

Roses are selling very low; good Bride and Bridesmaid can be bought at \$8 per 100, such as under ordinary circumstances should make \$5 to \$6. Lower grades of these and general stock have no real fixed value. Even special Beauty have been sold as low as \$10 per 100.

Carnations move slowly and are not as good property as they were two weeks ago.

Violets so far are the best selling goods on the market this week and sell for 50c. to \$1.50 per 100.

Violet teas have been a feature in society life this week. It will be to the Violet grower's advantage if they continue to be fashionable.

Chrysanthemums are in the cellars and boxes unsold—huge quantities of them. Excellent quality is offered at \$1 and \$1.50 per dozen, but buyers won't be tempted. Not so long ago a similar quality of blooms was bringing \$4 to \$6 per dozen.

Valley is moving fairly well, but it is hard to get; \$8 per 100 for extra grade is realized.

Lilium Harrisii are poor selling stock, and in hundred lots only make \$5; by the dozen \$1 is difficult to get, many being sold for less.

Cattleyas have not been plentiful this week and hold their price fairly well. Cypripediums make 10c. to 12c. each, and are coming in freely.

Roman Hyacinths are seen in quantity

now, but they are evidently poor selling stock. The fruit and vegetable market is in a poor condition at time of going to press. Business is dragging with everything in the buyers' favor; the wet, muggy weather helps these conditions. Toward the end of the week a change may be expected owing to the near approach of Thanksgiving. "If we can only have sharp, cold, clear weather," say the market men, "everything will be all right."

Hothouse grapes are averaging 75c. per pound for European, American-grown are being thrown away unsold.

Tomatoes make 20c. to 25c. per pound. Mushrooms are selling well at 40c. to 60c. per pound.

Frame lettuce are scarce and sell well. Cucumbers are selling slowly, owing to competition of Florida stock; 75c. per dozen is regarded as a very fancy figure.

Apples—Winesap, Va., poor to fair, \$1.50@2.50; good to fancy, \$3.50@4; Johnson's Winter, Va., poor to fair, \$1.50@2.50; good to fancy, \$3.50@4; Snow, State, poor to fair, \$2@2.50; good to fancy, \$3@4; King, State, poor to fair, \$1.50@2.50; good to fancy, \$3@4; Ben Davis, western, good to fancy, \$2.50@3.25; Virginia, poor to fair, \$1.50@2; good to fancy, \$2.50@3; Greening, State, poor to fair, \$1.50@2; good to fancy, \$2.50@3.50; Baldwin, State, poor to fair, \$1.50@2.25; good to fancy, \$2.50@3.25; N. Spy, State, poor to fair, \$1.50@2; good to fancy, \$2.50@3.50;

mixed lots, poor to fair, \$1@1.75; good to fancy \$2@2.50; open heads, poor to fair, \$1@1.50.

Pears—Seckel, per bushel box, \$1.25@2.50; per keg, \$1.50@2.75; Beurré Bon, per barrel, \$2@4; Keiffer, Jersey, per barrel, \$2@3; up-river, per barrel, \$2@2.75; Lawrence, per barrel, \$1.50@2.25; Beurré Clairgeau, per barrel, \$2@3; Beurré d'Anjou, per barrel, \$1.75@2.25; Vicar, per barrel, \$1.25@1.75.

Grapes—Delaware, fancy, per small basket, 13@15c.; common to good, per small basket, 7@12c.; Niagara, fancy, per small basket, 12; common to fair, per small basket, 7@10c.; Catawba, fancy, per small basket, 9@10c.; ordinary, per small basket, 7@8c.; Concord, per large basket, 11@12½c.; fancy, per small basket, 9@10c.; ordinary, per small basket, 7@8c.; inferior stock, small basket, 4@6c.; white kinds, in trays per 100 pounds, \$1@1.25; Catawba, in trays, per 100 pounds, 85c.@\$1; Concord, in trays, per 100 pounds, 85c.@\$1; very inferior, per 100 pounds, 50@75c.

Nuts—Northern chestnuts are still scarce, but the demand is light; a fair supply of southern offering. Prime to fancy northern quoted at \$5.50@6.50 per bushel of 60 pounds; most sales of southern at \$3.50@4; a few are held at shade higher but without important sales. Hickory nuts firm at \$1.75.

Carolina peas generally brought \$1.50. Brussels sprouts, per quart, 4@8c.

Canflowers—Fancy, per barrel, —; good to prime, per barrel, \$1.25@1.50; poor to fair, per barrel, 50c.@\$1.

Celery—Choice to fancy, large, per dozen, 30@35c.; fair to prime, per dozen, 15@25c.; small and poor, per dozen, 8@12c.

Cabbages—Red, per barrel, 75@90c.; Jersey and Long Island, per 100, \$3@4; State, per 100, \$2.50@3.50.

Carrots—Washed, per barrel, \$1@1.25; unwashed, per barrel, 75@90c.

Cucumbers—Florida, per crate, \$1@1.75.

Egg plants—Florida, per barrel, \$3@8; Florida, per box, \$3@4.

Green peas—Virginia, per one-half barrel basket, 50c.@\$1.75; N. C., per one-third barrel basket, \$1.25@1.50.

Onions—Orange Co., red, prime, per bag, \$1.75@2.25; yellow, per bag, \$1.50@2; white, per bag, \$1.50@3; inferior, per bag, 75c.@\$1.25; State and west, yellow, per barrel, \$1@1.75; eastern, white, per barrel, \$2@3; eastern, red, per barrel, \$2.25@2.50; eastern, yellow, per barrel, \$2.

Okra—Florida, per carrier, \$1.50@2; Charleston wax, prime, bushel basket, 75c.@\$1.50; Charleston, green, per bushel basket, 50c.@\$1.

Squash—Hubbard, per barrel, \$1.25@1.50; Marrow, per barrel, \$1@1.25.

Turnips—Russia, Canada, car lots, per barrel 50@75c.

Potatoes are firm and likely to improve in value.

## Boston.

Boston market celery is in good demand at about \$1.50 a dozen; all other grades remain as last week.

Squash—Marrow, \$1.25 a barrel; Hubbard about \$20@25 a ton, if good. Unless the goods are very fancy, they will not bring these top prices; this means hard-shelled; Turbans \$1.25 a barrel, or \$20 a ton.

Onions remain about the same as last week, that is, \$2 per barrel; Spanish nearly cleaned up, \$1.50 a crate, which is supposed to hold 50 pounds, but very seldom does.

Shell beans practically done, only a few coming here; string beans in good demand if good stock, but most of it not very good.

Turnips—Yellow stock 85c.@\$1 a barrel; white French, \$1; white flats 30c. a bushel.

Radishes 25c. a dozen bunches. Spinach 15@25c. a bushel. Beets 50@75c. a dozen bunches. Carrots 75c.@\$1. Parsnips 50@75c. Parsley 50c. Artichokes \$1.50 a box. Leeks 40@50c. a dozen.

The market on cabbage remains very dull; no change in price, 3c. a head. Cauliflower is in a little better demand, selling at 12½@25c. a head.

# COULD NOT EAT.

## A Woman's Strong Constitution Wrecked. Effects of a Treacherous Disease. A Wonderful Case.

From the Bulletin, Monroe, La.

Mrs. Stephen Robbins is the wife of a prominent farmer living on a large and well-kept plantation just at the edge of Monroe, La. They have resided in this community but two years, having moved here from Illinois. The change was made for the benefit of Mrs. Robbins' health, her physicians having advised her that it was the only hope of her ever regaining her lost health.

"Three years ago this last winter," said Mrs. Robbins, "I was very sick with that most treacherous disease, the grippe. I had a very severe time with it, but was able to get out after being confined to my home several weeks. I think I went out too soon, for I immediately contracted a cold and had a relapse, which is a common occurrence with that disease. For several more weeks I was confined to the house and after this I did not fully recover until recently. I was able to get out again, but I was quite a different woman.

"My former strong constitution was wrecked, and I was a dwindling mass of skin and bones. My blood was thin and I had grown pale and sallow. My lungs were so affected that I thought I was going into consumption. During my illness I had lost thirty pounds in weight. I tried to regain my strength and former good health by trying different medicines and physicians, but nothing seemed to help me. My appetite was gone, and when I ate the food it would not stay on my stomach.

"The only thing my physician said for me to do was to take a change of climate, and on his advice I came here. At first I seemed benefited, but to my sorrow it proved to be only temporary, and in a few months I was in my former condition. The color had left my cheeks, I had no energy, and life was a misery. I had become a burden to myself and family. Finally, I happened to read in a newspaper of how Dr. Williams' Pink

Pills for Pale People had effected a miraculous cure with the same disease which a neighbor of mine had in Illinois.

"On the strength of this testimonial I decided at once to give the medicine a trial. I accordingly sent for a box of Dr. Williams' Pink Pills for Pale People, and gave the pills a thorough trial. I did not notice any change till I had tried the second box. I was discouraged a little with the result of the first box, but knowing that I should not expect a sudden cure of such a chronic case as mine, I tried the second box with the result that I immediately began getting better. I used five boxes of these pills and was completely cured, as you see me to-day, weighing more than ever before."

As evidence of the truthfulness of her story Mrs. Robbins volunteered to make the following sworn statement:

"I hereby affirm that the above statement is every word exact and true."

"Mrs. STEPHEN ROBBINS.

"Monroe La., March 2, 1897."

"Subscribed and sworn to before me, a notary public in and for the Parish of Winn, State of Louisiana, this the 2d day of March, 1897."

AMOS R. JESUP, Notary Public."

Dr. Williams' Pink Pills for Pale People contain, in a condensed form, all the elements necessary to give new life and richness to the blood and restore shattered nerves. They are also a specific for troubles peculiar to females, such as suppressions, irregularities and all forms of weakness. They build up the blood, and restore the glow of health to pale and sallow cheeks. In men they effect a radical cure in all cases arising from mental worry, overwork or excesses of whatever nature. Pink Pills are sold in boxes (never in loose bulk) at 50 cents a box or six boxes for \$2.50, and may be had of all druggists, or direct by mail from Dr. Williams' Medicine Co., Schenectady, N. Y.

Hothouse cucumbers show very little change from last week, unless very well assorted. Fancy goods bring little above the quotation, \$6@8 a hundred.

Hothouse lettuce in good demand; orders coming in from other sections make our market quite bare of it; selling 85@50c., a raise of 10c. from last week.

Mushrooms selling 25@40c. a pound; very dull.

Hothouse tomatoes 20@80c. a pound.

Hothouse grapes 25@50c. a pound; takes a very choice article to bring the top price.

The potato market is a grade firmer. Green Mountain stock, asking price today 80c. a bushel; Hebrons 75@80c.; White Stars about 75c. a bushel. Sweet potatoes \$1.75 a barrel.

Mint 40@50c. a dozen bunches; oyster plant 75c. a dozen.

Oranges—150-176 count. Florida stock, \$4.50. Grape fruit \$6@7.50.

Pears—Market is active; very fair demand for Duchess at \$1.50@2.50; Buerré Bosc \$3@4; Buerré Clairgeau \$2@3; Buerré d'Anjou \$1.25@2. Quinces dull, \$1.50 a bushel.

Cranberries are a little firmer for hard nice goods. It is getting near Thanksgiving when everybody eats turkey and cranberry sauce. Ordinary stock selling about \$5, with fancy \$5.50. Crates \$1.75.

Egg plants in good demand at about \$4.50 per crate of two dozen.

Northern chestnuts \$6 a bushel.

Apples—Greenings \$2.75@3; Baldwins \$3@3.25; fancy red eating apples \$3@3.50 a barrel. These prices are for No. 1 stock.

Grapes—Concords, large baskets 12c.; Niagaras 12c.; Salems and Catawbas 13@14c.; small baskets 8@10c.

### Onions and Apples.

The onion growers of western New York have agreed among themselves to hold their product for higher prices. The result is, dealers are buying in Michigan and other Western states at the market price. Ten thousand bushels, purchased at 50 cents per bushel, are en route from the West for storage. Lyons growers have harvested about 20,000 bushels, and but very little of the local crop has been marketed. An early freeze would catch thousands of bushels now piled in tiers out of doors.

The apple market, open, presents marked contrast compared with last year. Kings are worth \$3, Ben Davis \$2.50, Baldwins \$2.75, and Greenings \$2.25 to \$2.50. Cider stock last year brought 5 cents a bushel. The present price is 30 cents. Notwithstanding the tremendous decrease of production this year, it is a fair presumption that the average orchard will produce more profit this autumn than last. A thousand-barrel orchard last year brought in not to exceed \$750 gross. After deducting the cost of barrels at 30 cents each, the proceeds were reduced to \$450. The same orchard this year will clean up about 250 barrels, which, if sold at the present prices, will bring an average of \$2.50 per barrel, or a total of \$625. The cost of barrels will be only \$62.50 this year, leaving \$562.50 to pay for picking and hauling 250 barrels, as against \$450 to pay for picking and hauling 1,000 barrels last year.

### From a Well Known Fruit Grower.

I have just finished looking over some back numbers of AMERICAN GARDENING. It seems to be peculiarly fitted to fill the popular need in its line. It cannot fail to be a success and a growing success.

O. W. BLACKNALL.

The Henry Strawberry plants came all right in good condition. I hope they will do well for me, but good or bad, I shall let you know later my treatment of them. AMERICAN GARDENING is always very interesting to me, and more so at this time when we are all under strictest quarantine. I am very much interested in Mr. Jerolaman's letters, and hope after he has exhausted the strawberry, he will write of something else.—C., La.

# OUR CLUB LIST

LET US FILL YOUR ORDERS FOR 1898.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

AMERICAN GARDENING, P. O. Box 1697, New York.

# Henry Strawberry Plant Premiums

Will be shipped to all who desire them this season until ground freezes.

**Owing** to the wonderful run on this unequalled Strawberry we are preparing 100,000 Henry plants for Spring delivery, and in this connection we desire our readers to remember

## Two Facts

- 1—The Henry Strawberry can be obtained solely through a subscription to AMERICAN GARDENING; as the publishers will not sell plants under any consideration;
- 2—Neither will Mr. Jerolaman.

## Who is Entitled to Plants

**New and Renewal Subscribers.**—Five plants of the Henry will be mailed, postpaid, as a premium to every Renewal or New Subscriber sending us \$1.00 for a year's subscription. When remitting be sure to state if you want this premium.

**To Agents and Workers.**—For every \$1.00 received from agents and others for New Subscriptions, we mail, postpaid, Ten Henry plants, Five to the New Subscriber and Five to the Agent.

## Special to Club Raisers!

**Clubs of Ten.**—To every agent sending us in a club of Ten New Names and \$10.00, we will forward in payment therefor One Hundred (100) Henry Strawberry Plants, by express, as well as send Five plants, postpaid, to each person in the club.

Mr. Jerolaman's series of articles has been put in pamphlet form; and agents will be supplied with copies on application. Best campaign matter out.

FIG. 222.—WEEPING WILLOWS AS SEEN IN THE BOSTON PUBLIC GARDENS.

For planting on the banks of streams and lakes, there is not a tree that can vie with the Weeping Willow (*Salix babylonica*) for perfection of repose and solemnity of effect. Of beauty as an individual tree, the Weeping Willow is never able to appear to best advantage except when used as suggested above.

On presenting the present picture, we take the occasion to remark that, rarely, if ever, has there been as satisfactory a photograph of this tree, most difficult to picture.

## Strawberry Culture in December.

### Winter Protection.

Winter protection should be applied as soon as the ground freezes hard enough for a wagon to drive over the fields without breaking through the frozen crust. The chief object in winter protection is to lessen the heaving of the soil and the consequent breaking of the roots and rootlets of the plants. The stiffer the soil the worse the heaving, and the greater the necessity of protection.

The covering should not be thick enough to entirely prevent the soil from freezing, but to greatly lessen the freezing in the severest weather. Pine straw, a little less than an inch deep after it settles, is the proper depth in this latitude. It would have to be deeper in proportion as you went North.

In winter protection at the North, the whole ground should be covered, beds, middles, and all.

The varieties of material that can be used are almost endless. Where pine straw, or pine needles, as it is often called, can be obtained, it is almost the ideal covering. Of all similar material it is the least likely to be blown off. Wheat straw, oat straw, marsh grass and other similar things are used. Cornstalks can also be used, but as they do not lie close a much thicker layer will, of course, be necessary.

The great objection to oak and similar leaves is that they blow off so badly, which is also the case with oat and wheat straw unless they are very fine-cut. Yet such leaves and straw are often used and anchored in place by placing on them small stones or a little earth at short intervals.

All available stable or barnyard manure should be used for this purpose, taking the place of other material. If coarse it can be applied quite thick directly over the plants. If very fine it will be best to use it mostly around and between the plants and to put a coarser, more open material just over the plants. The effect of too close a material over plants is to bleach and make them tender. Whatever covering is used it must be nearly all removed from immediately over the plants about the time that growth begins in the spring. The material can be left around the plants and between the rows, where it will serve the double purpose of keeping the berries clean and of conserving moisture then so essential to a good crop.

Whether winter protection pays or is even advisable south of the Mason and Dixon line is uncertain. I have experimented for many winters. Some winters it did good; some winters it seemed to be rather harmful. It certainly would not be advisable farther South where crickets and harmful insects harbor under it and feed on the plants. Besides, the warmer the climate the more danger of smothering and bleaching the plants.

But stable or barnyard manure is excellent in any climate if properly used. I have never known any insect pests to harbor under it.

At the South it should be applied around and between the plants. Used in this way with a liberal dressing of hardwood ashes (fifty bushels to the acre can be used), or 800 pounds of kainit in place of the ashes and 300 pounds of acid phosphate, a heavy crop of fine berries will almost surely be made. The fertilizer should be applied before the manure. It is also good to use without the manure.

### How to Plant.

Plow the land well and deeply, harrowing if cloddy. Sandy loam will rarely need harrowing. Run off rows three feet apart. Two and a half feet will do if land is scarce, though it makes plowing somewhat more tedious. Sow in the furrow cotton-seed meal at a rate of 300 to 500 pounds an acre. Mix it with soil by running cultivator or plow down the furrows. List in this with a light furrow from each side. Work list down very low with hoed or a horse drag. Set plants fifteen inches apart, or eighteen

inches if it is a stout-growing variety and the soil is very rich. Plant deep enough to cover roots well. Plants can safely be set a little deeper in winter than in spring.

Other fertilizer can be used. I recommend cottonseed meal as being less likely to damage newly-set plants should it come in contact with their roots. But there is but little danger of this in the cool, moist fall and winter weather.

Kainit and acid phosphate can be applied at any time afterwards around or between the plants, and in quantities above recommended.

I often use a ton of cotton-seed meal to the acre, applying it broadcast and harrowing it in well before listing and planting. Still a barnyard manure can be used to great advantage if likewise broadcast and plowed in. Where plentifully used no other kind of fertilizer need be then applied.

### The Advantage of Late Fall and Winter Planting.

South of the latitude of Washington, D. C., late fall and winter planting is the safest and surest, except on stiff, wet soil given to heaving during hard freezes. On such heaving soil the young plants, if unprotected, are liable to be lifted out of the ground if planted too late to get a hold before very severe weather sets in—say between November 15 and March 1.

But the danger of heaving can be prevented by a moderate covering of straw or manure placed mostly around the plants but some of it on them. In fact, young plants may be set in any climate, be it ever so cold, at any day when the ground is not frozen if at once covered with straw or manure to a depth corresponding to the coldness of the climate. The covering need, and indeed should not be thick enough to entirely prevent the ground from freezing, but only to materially lessen the freezing and heaving.

The advantages of late fall and winter planting are manifold. The ground then being always moist and the sun weak, there is rarely need to wait for rain. Enough fairly pleasant weather is pretty apt to come to plant in. There is then no rush of work as in the spring, and the preparation and planting can be thoroughly done. If a cold snap should stop the work, the plants can easily be packed away to keep until it is past. Even if it should be necessary to keep them for several weeks they are in no danger as long as they are kept moist and cool.

It is very hard not to get a stand at such a time. If the planting is left till spring, bad weather is apt to throw it back until late. The sun—the arch enemy of the newly-set strawberry plant—is then rapidly gaining power and dominion. Drought is more than apt to come. A newly-set plant checked by drought is hard to recover, and is never as vigorous as it would otherwise have been.

I have seen it stated that spring-set plants, starting as they do in freshly-plowed land, grow off better. I will admit that they do grow off nearly or quite as well, if there is plenty of rain. But that is a big "if" of late years.

Spring drought brings more than one evil. The plants are not only checked and retarded in growth, but cut-worms then get in their deadly work on the tender plants. I have never known them to seriously harm fall or winter-set plants, as they are vigorous enough by spring to defy the cut-worms.

I do not mean that strawberries cannot be successfully set in spring, for thousands of acres are successfully planted that way. I mean that on the whole, late fall and winter planting is the safest, surest, and best.

O. W. BLACKNALL, N. C.

### Our Strawberry Pamphlet.

Owing to an expressed desire by the writer to thoroughly revise his series of articles on "Big Berries for All," it may be early in December before we will be able to issue the booklet. It will be well worth waiting for, however, as we confidently anticipate that it will prove the best treatise on the subject ever written, and practical to the core.

## The Vegetable Garden.

### Plan for Another Year.

It is frequently desirable to renew the stock of such permanent roots as rhubarb, asparagus, etc., and it is just as well to determine such matters, while they are in mind, and keep a memorandum of them, so that they may not be overlooked when the time comes to order the seeds.

### Rhubarb.

The two varieties of rhubarb, Victoria and Linnæus are the best for culinary purposes, and it is just as well to have a little of both sorts, Linnæus being the earlier. It does not pay to grow the old-fashioned deteriorated small variety, so often seen in the amateur's garden.

### Take Note of Variety Behavior.

Make a note of all the varieties of vegetables that succeeded best in your own garden, as well as those that did not appear to do so well, or were unsuitable. There are many little details of this kind on our minds now, which we all think we can remember in the spring, but when that busy time comes, are often overlooked and forgotten, so that it is a good plan to keep notes of such matters. They will prove useful as a guide another season.

### Peas.

The most satisfactory all-round variety for general crop with us this year was the Alpha; it is a fine tasting, wrinkled sort, and a very heavy yielder, and growing only about two feet high; it does not require to be planted so close as do the larger growing sorts, and it is also easier to support. Every lover of peas should make a trial of it.

The New Life pea is another very promising new one, and well worthy of a trial.

### Beans.

The Early Valentine Wax and Wardwell's Wax are two very excellent croppers; they have a strong constitution, hence they are not so subject to the rust that spoils the appearance of many other beans.

### Lettuce.

Henderson's New York is a splendid large-headed sort, standing drought well in the summer without bolting. It is very tender and crisp, and in every way desirable.

The Trianon Cos is deservedly popular with those accustomed to it. It is now and always has been extensively grown in the best conducted gardens both here and in Europe. Those who have not yet tried this class of lettuce, should not fail to do so another year.

### Beets.

The Brazilian beet belongs to the ornamental section, and is extremely attractive and showy, the leaves are handsomely netted in yellow, pink, and dark red. Some of these planted along the main walk are interesting, and moreover the leaves are excellent as greens.

Any large beet-roots of the ordinary varieties, that are a little old for use, can be utilized at this season to grow greens for winter use, if one have any spare rows under greenhouse benches, or in the hot-beds. If planted thickly in any moderate heat, where they can have some light, they will soon give a crop of leaves.

### Vegetable Dainties for Winter.

There is no reason why many little dainties should not be had all through the winter in any ordinary place. Lettuce can easily be had in frames outside, rhubarb in the cellar, chives, parsley, mint, mustard and cress in a warm window. Of course where a greenhouse can be used, these can be grown more satisfactorily, and also many others may be added.

W. M. EDWARDS, Conn.

## West Va. Horticulturists' Talk.

The fifth annual meeting of the West Virginia State Horticultural Society met October 12, at Martinsburg, W. Va.

The meeting was well attended and a great local interest was manifested in the number and character of the questions asked. The policy of the promoters of this state organization in carrying it from place to place over the state is proving a good one. It elicits local interest, brings fruit growers from different quarters of the state in touch with one another, and affords those who identify themselves with the work a wider knowledge of the resources and possibilities of the state for horticulture than they could obtain in any other way. This year the interest in our meeting was quickened by the presence of the Assistant Secretary of Agriculture, Hon. J. H. Brigham, of Washington, D. C., who brought many encouraging thoughts to the members of the Horticultural Society. Mr. Brigham pointed out the necessity for more diversified agriculture and the steps which the department is taking to secure a home production of sugar and wool, and also its careful supervision of all meats and dairy products offered for export. All were better acquainted with the U. S. Department of Agriculture at Washington at the close of the address.

The discussion of the San José scale by Dr. A. D. Hopkins, of the Experiment Station, at Morgantown, who had made some investigations of the infested orchards in Berkeley County, was listened to with much interest. The question is a vital one for the fruit growers of the Eastern Panhandle of West Virginia, because it is in the area in which this pest is most likely to be able to establish itself. It is believed the greater portion of the state, because of its altitude, will never be seriously troubled by the pest, should it be introduced. Most careful quarantine and preventive measures should be adhered to in all localities, however, so as not to invite any such menace to horticultural interests of a state as the pernicious scale is liable to prove. Personally, I believe no tree is too valuable to be destroyed if infested by such a terrible pest as the San José scale might prove to be in any locality.

Mr. Rothwell, of the Cold Storage and Cannery Company, pointed out the advantages of cold storage to fruit growers, also mentioned three points which the grower must attain in order to attract buyers; first, variety; second, quality; third, quantity.

### How Peaches Ripen.

Varieties of peaches was discussed by Hon. Alexander Clohan. He emphasized one important fact which distinguishes the early from the late peaches. Early peaches ripen from the pit towards the surface, while the late varieties ripen from the surface towards the center. This mark of distinction being sufficient to make the difference between the shipping and keeping qualities of early and late peaches. Softening or ripening near the pit first makes the early peach a poor carrier and a poor keeper.

### York Imperial Apple.

Under title of "The Coming Apple," several varieties were discussed and their merits pointed out, but the York Imperial, which is already a valuable commercial apple in Berkeley County, was named as the coming money-maker for that region. "It is now here, for one orchard produced some 5,000 barrels this year, which sold for \$2.50 per barrel."

Prof. L. C. Corbett, Horticulturist of the State Experiment Station, gave some of the many reasons why the people of the state should throw more of their energies into fruit growing and market gardening. The possibility of Western competition was considered, and against this was laid the location, the transportation facilities by rail and water, and the general fitness of soil and climate for fruit growing. The results already obtained by the apple growers of Hancock County, W. Va., were alluded to, and the splendid methods of picking, packing, and storing there practised brought out

the danger of becoming content with present conditions and methods; and the results consequent upon such a quiescent state were set forth with the suggestion that we should study the methods, practices, and conditions of our competitors in fruit production.

## Home-made Plant Brackets.

Persons having a small greenhouse, naturally wish to make the most of the limited space. In most houses there are many odd corners and spaces which become available by using brackets of some kind. To make neat and serviceable brackets for such purposes without cost and very little trouble, I have used common tin cans and find them excellent serving both as bracket and saucer. To make, take tin cans of any size, bright clean ones preferred, and with any stout scissors cut as shown in accompanying sketch.

A good-sized carpet tack will hold the bracket firm enough to sustain as large a pot as the bracket will accommodate. They can easily be decorated for use in window gardens, etc.

JOHN VAN DER LIPPE, N. J.

## A Flower Pit in Louisiana.

This is the 17th of November and we have had no killing frost yet, but the small tender plants are safe in the pit,

FIG. 223. —HOME-MADE PLANT BRACKET.

and let me tell you what my pit is: Just two long narrow boxes, one four inches shorter and narrower than the other, the smaller set inside the larger, and the space between filled in with dirt and leaves; the box is not slanting at the top, but that would be better. I lay sash over the box or pit as it is called, in severe weather, and if it is very cold, cover over the sash with wheat bran sacks. My pit is on a high ridge and water does not get in. Mine is a little over three feet deep, so will take pretty large plants. During a sleet that lasted a week last winter, I never lost a plant. The pit was an idea of my own. There is a woodshed and stable north of it and shrubbery and vines all around except to the south. The plants in the pit require very little attention.—MARGARET E. CAMPBELL.

## About Tobacco.

The information needed can be obtained from a valuable pamphlet containing notes by 14 growers living in different parts of the country, price 25c. Or from another work on the subject, Tobacco, its history, variety, culture, manufacture, etc., by E. R. Billings; price \$2.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

## The Fruit Garden.

### Pruning of Pear Trees

Looking over the work to be done among the pear trees, it occurred to me that it might interest some of the readers of AMERICAN GARDENING if I added to my former notes on pear trees and the pruning of them, because I have an idea that as regards the latter part of that sentence I have had but little to say. Perhaps because that suited me best, and possibly for fear some may say, "chestnuts" to my facts or figures.

However, as I believe every true gardener is more proud of his own creations than of those left to him by his predecessor, I will try to briefly set forth a few facts regarding my trees and methods of treatment.

### The Starting Point.

First, I have no use for extra size long-stemmed fruit trees of any kind, but prefer rather short, young nursery stock, which can be cut back to four feet or less from the surface.

These will make several growths of 10 to 15 inches the first summer. Select three or five from which cut away one-third early in the fall. Any surplus shoots can be cut clean away later.

### Second Year.

The following summer let the three best-placed breaks from each shoot grow without stopping until August, when pick out the points, stopping in June all breaks not wanted for leading side branches.

I have not spoken of a central leader, for there is generally too much of that (unless it be in such varieties as Souvenir du Congrès and Josephine de Malines.)

### Third Year.

The third summer follow the same general rule, but do not stop the leading branches, for the majority of these points will likely be flower buds. The fruit here or a few bunches on the wood of the second summer, will bring the slender branches to almost a horizontal position, and give the young shoots started near the extreme point a good impulse to extend in the same direction, as the growing weight gradually brings it down.

### Fourth Year.

By the end of the fourth summer you can size up your tree and decide if it need root pruning, manure, or only an admirer.

### A Few Facts and Figures.

Now for a few facts and figures from some trees worked on the same style, planted in the fall of 1890.

Beurré Hardy has a stem five inches in diameter. Made in 1895 a side growth of 40 inches, on which are now 41 spurs; 19 of these bore fruit this summer. Another growth of 36 inches has 30 spurs, 9 of which bore fruit. The height of tree is 17 feet and spreads 13 feet.

Beurré Superfin; an average growth of 1895 is 30 inches long, with 24 spurs. Height of tree 12 feet, spread of branches 9 feet.

Lawrence, trunk 5 inches in diameter, length 18 inches, spread 12 feet, height of tree 13 feet. A growth of 1895, 24 inches long, shows 16 fruit spurs, from 6 of which fruit was picked, and 2 wood growths of 8 inches. The same main branch extended in 1896 11 inches and this summer made 12 spurs and produced fruit on the point, and a growth of 13 inches.

These trees are not starved, neither have they been root-pruned, because I have spurs as thick as I want them extending right back to the bole of the trees.

This seems a lot of words about a tree or two, but I am rather a crank about a few things, and the annual tree and shrub deformation is one of them.

J. HOLLOWAY, N. Y.

**Fertilizer for Berries.**

Accepting the conditions of J. M. C. Michigan, page 779, I would rather haul the well-decomposed manure five miles, than get the sawdust mixed in my soil.

Mixing ashes with the sawdust might help to prevent insects being rapidly propagated in the soil, but I would prefer to use the ashes alone, and if the sawdust is fresh or even two or three years old I should not under any consideration, work it into soil where I wanted to plant strawberries.

Some kinds of muck (as it varies in quality) might pay for the trouble of hauling, as it is on the farm, but I would rather spend the time in hauling the ashes and scattering broadcast at the rate of a bushel to the square rod and the decomposed manure well-rotted should be scattered about an inch in depth if soil is in fair condition, and still deeper if poor soil. Cultivate in that it may become thoroughly incorporated with the soil.—C. C. N.

The following is the average amount of plant food contained in two of the materials mentioned:

	Pounds in 100 pounds.		
	Nitrogen.	Potash.	Phos. acid.
Muck.....	0.79	0.00	0.13
Ashes.....	0.00	5.89	1.51

Both varying greatly with the source of sample.

In addition to the plant food which it contains, muck is valuable for its organic matter. It is better in its effect and safer to use than sawdust; the latter, unless very thoroughly decomposed, is very apt to make the soil sour. Five tons of muck and one-half ton of wood ashes per acre would add, on the average, about 60 pounds of nitrogen, 54 pounds of potash and 28 pounds of phosphoric acid to the soil. Only a portion of this plant food is available at once; slacked lime would have but little effect in increasing the availability.

If the slacked lime is mixed with the sawdust at the rate of one ton to ten, thorough decomposition will be hastened and the product could probably be used to advantage on a sandy soil. It is, however, not worth the labor so long as a supply of muck is available.—JOHN FIELDS.

For J. M. C., I would recommend the muck composted with lime in the furrow before setting the plants. Then spread the ashes on top the row after plants were set; would not expect much good from the sawdust. Use plenty of muck and ashes, but not too much lime.—C. WRIGHT, Del.

**Fertilizers for Strawberries.**

It is more than probable that wood ashes or commercial fertilizers alone would not produce the same beneficial effect as the mulch of fine manure. The latter, in addition to the plant food which it contains, helps the soil to hold the moisture for the young plants. 1000 pounds of wood ashes mixed with 100 pounds of nitrate of soda and scattered on the surface on each side of the rows, as advised for manure, would supply a sufficient amount of plant food. (See page 779.)

If this is then covered with a layer of chopped straw, chaff, leaves, manure, or other material as a mulch, the result would be expected to be practically the same as if it had been possible to follow the method advised.—J. FIELDS.

W. W. Smith (page 779) can find a good substitute for stable manure for his strawberries by plowing under Crimson clover and seeding the ground with cow peas and turning these under. The following spring set plants on this ground, at the same time applying 500 to 1,000 pounds good high-grade phosphate, high in nitrogen and phosphoric acid. Or if he has good ashes, use 50 to 100 bushels broadcast per acre, after the plants are set; or if for old beds that are expected to fruit, apply the phosphate and ashes on the beds in January or February. This plan is largely followed by growers in this vicinity.

**Leaves for Manure.**

To make leaf mold is always slow work, and needs to be done systematically to insure a good supply. Begin in the fall and store all the leaves possible in a square dug pit or a square heap; build solid, and water them as they are being put together; they will have to stay for a year, and then should be turned thoroughly. After that they rot very rapidly, and soon yield a stock of soil. In turning, see to it that the heap stands on fresh ground, and that will enable you to place each season's new leaves in your sunk pit.

Until you have done this, your leaf soil will have to be gathered from the woods, a system that is never satisfactory.

Leaves vary in their composition according to the season of the year. The following figures may assist our inquirer of last week:

APPLE LEAVES.	Water	Ash	Nitro-Gen	Phos. Acid	Potash
In May.....	72.86%	2.33%	.4%	.25%	.25%
In Sept.....	60.71	3.46	.39	.19	.30
October 1st..	47.98	4.96	.96	.25	.92

For sake of comparison, we insert composition of

Green corn..	78.61%	4.84%	.41%	.1%	.33%
Green yec....	72.08		.80	.12	.64

Thus it will be seen that apple leaves have as much or more of fertilizing constituents than materials commonly used as litter. Other leaves will not vary greatly from these figures. The ash of leaves has about the same value as that of wood ashes and should be saved.—ED. AMERICAN GARDENING.

Decomposition of leaves is quickened by the addition of lime to the heap; but this is unsuitable for leaf mold. Instead, mix sufficient fresh horse manure with the leaves, see that they are moist enough, and turn over in a compact heap, thus inducing them to heat, which greatly accelerates their rotting. If this could be done in any unused building or barn cellar where it is somewhat protected from the coldest weather, and will consequently keep warm longer, the leaves will rot more quickly.—W. M. EDWARDS.

**Wintering Berry Seedlings.**

J. J. Seelye, N. Y., is advised to sink his boxes of seedling strawberry plants into the ground so that the surface of the soil in the boxes will be even with the surface of the ground, and cover with two inches of dry leaves, and over them place evergreen boughs or the cornstalks will do if the evergreen boughs are not convenient to hold the leaves down. Providing there are holes in the bottom of boxes for drainage, the plants will come through in fine condition. Do not water during winter, as the leaves will hold the proper amount of moisture.—C. C. N.

**Plum Burbank.**

The fruits from trees grown by taking up sprouts from the Burbank plum, mentioned on page 779, will be worthless, as the tree will not be like the Burbank and it will always persist in sprouting up from the roots.—C. C. N.

As all our trees of Japanese plums are budded upon Marianna plum stocks, the sucker which has come up a few feet from the tree as stated on page 779 would be of little value, as the Marianna bears a small plum much inferior to the Wild Goose.

The double-flowering peach referred to seldom bears fruit. When it does, they are usually twins or triplets, the fruit being elongated, greenish, and with decided almond flavor, but of poor quality. It is only intended as an ornamental tree. It is a rule of our establishment to always send a few extra trees to compensate in part for freight charges; hence this tree was no doubt sent as an extra.—P. J. BERCKMANS.

Margaret E. Campbell's Burbank plum was probably grafted on some plum stock and the suckers are from this. The

Burbank will root above the stock, but I have never seen it sucker. She can easily compare the leaves and wood of the suckers, and if they agree exactly with that of Burbank, plant some and fruit them, but my opinion is the suckers will not bear Burbank.

The peach is some double-flowering sort for ornamental purposes and may have been sent as a gift.—C. WRIGHT, Del.

**Chrysanthemums Not True to Color.**

Replying to your correspondent (page 779), in reference to Chrysanthemums coming of a color different from that of the type (such as Geo. A. Magee and Vivand-Morel,) I would say that it is no uncommon occurrence for varieties to turn white.

The only solution that I have ever been able to find for it is that there is something in the soil that affects the peculiar coloring matter of certain varieties. Take for instance, the variety Pink Ivory; in many sections of the country this year it is coming white. In my own case a portion of the plants have come true to color, others have come nearly white, and others absolutely white, and so far as I have been able to investigate there appears to be no cause for it other than the chemical conditions of the soil in which the plants are growing.—JOHN N. MAY.

**Rose Madam Marie Blanchi.**

I do not know any Rose of this name and think your correspondent (page 795) must be slightly mistaken in the name, as there are several varieties with names somewhat similar, but all are varieties not found in general cultivation, as they do not suit our climate, and are not quite good enough to rank with the best.—JOHN N. MAY.

**Planting Raspberries in Fall or Spring.**

Replying to H. C. C. M., Conn., (page 795), I would prefer fall planting. After the plants are set, cut down the canes to one foot above ground, and when settled cold weather comes, mulch with litter.—W. M. EDWARDS.

**How to Use Cow Manure.**

Pile it under shelter over winter. Cow manure is excellent for strawberries, but it proves to be the means of introducing many destructive insects, such as white grubs, hence, is not considered safe to use for those plants.—W. M. EDWARDS.

**Flowering Shrubs for Cut Flowers.**

The following are satisfactory for purposes named by H. J. M., page 795, and will flower nearly in the order named, from April to October; those marked with \* are the choicest and best:

Daphne Mezereum, Forsythia (Golden Bells), \*Cercis Japonica, \*Azalea mollis, \*Exochorda grandiflora, \*Almond, \*Spiraea prunifolia, Halesia (Silver Bells or Snowdrop Tree), Honey-suckle, \*Deutzia gracilis, \*Viburnum plicatum, Weigela in variety, \*Lilacs in variety, \*Rhododendrons, Deutzia crenata, Spiraea, Bumalda, S. callosa, Clethra (Sweet Pepper Bush), \*Hibiscus syriacus (Rose of Sharon), \*Hydrangea paniculata grandiflora, Vitex, Symphoricarpos (Indian Currant), Berberis vulgaris.

**List of Vines for Piazza.**

Replying to the question on page 795, I advise Clematis paniculata, Aristolochia Siphon, Lonicera Halleana, and Wistaria sinensis.—W. M. EDWARDS.

**Keeping Gladiolus Bulbs.**

I have grown Gladiolus for the past six years, with good success, and have taken the premium at the flower show held at Marblehead the past three years, and in answer to H. M. D., would say that this is my way of growing and taking care of them:

Plant at any time from April to June,

in any fairly good soil, well spaded, set in rows three inches apart, plant in full sun if possible. After fall frost, lift the bulbs, and after removing the tops, let them dry for two of three weeks in any airy position under cover; then, after removing the roots, store them in a cellar or any cool dry place away from frost, for planting again the following spring.

I use ordinary grape baskets to keep them in, suspended on nails, driven in the floor timbers of my house in the cellar.—W. H. S.

E. F. L. can propagate the blackberry by root cuttings. Cut up the roots about three inches long, in the fall; bury in ground and plant early in the spring like potatoes, but cover very lightly till they sprout and come through. The Wilson, Lucretia Dewberry, and other trailing kinds and blackcap raspberries are propagated by making a hole two inches deep, after a rain in September and inserting the tip of the vine in the hole and pressing dirt tight. This makes a bunch of roots and may be removed in November, but is better if it is allowed

### A Useful Lawn Truck.

At this season of the year and again in the spring when work on the lawns is considered, one of the problems confronting those who are entrusted with their care is how to use wheelbarrow, cart, or whatever may be available for the purpose of carting away leaves, trimmings, refuse of any sort, or how to get manure on or off without the wheels doing damage to the grass surface.

Very frequently it happens when much work has to be done and running planks are not available, that a most serious loss is incurred in the after making up of the grass surface; and more than that, damage is hard to rectify.

It is the duty then of the gardener or those in charge to prevent this, and that is not always easy to do. However, very recently there has been brought to our attention an invention of the Farmers' Handy Wagon Co., Saginaw, Mich., which obviates the difficulty referred to, and also that of getting about on loose soil. The lawn truck of this concern is the best implement of its kind that we

wheels tracking inside of rear wheels, thereby rolling a space of lawn two feet wide whenever driven over it.

The low, broad platform is just the thing for easy loading by one man, and when rack or side pieces are put on, a man can haul off a large load of dry leaves or rakings.

It is handy for hauling fruit, small loads of hay and for light, one-horse farming.

The track is built narrow so as to allow truck, to be driven on walks, and front wheels turn completely under the platform, permitting truck to be turned in its own length. It makes an excellent foundation for a step-ladder when picking fruit or trimming trees or shrubbery.

It excels as a sprinkling wagon. A man standing on the ground can easily fill loaded water barrels for hauling to shrubbery removed from water works.

### That Unruly Rose Again.

Thanks to both of you, November 15, p. 775, but both are wrong! Here in Louisiana we never graft Roses. The

FIG. 224. —COMBINED LAWN TRUCK AND SPRAYING MACHINE.

to remain till spring, cutting cane away from old plant.

Red raspberries sucker and it is only necessary to plant them on rich damp land and cease cultivation early in the season. Nurserymen often take up the green plants and set in rows and make what are termed "transplants" out of them. Heap up the dirt high around the currant bushes which must have been allowed to "stool" a good deal. These will send out a few roots and the following spring set out these plants in rows well manured, and keep cultivated the entire season. Currants often root well by simply making a cutting six or eight inches long and set in nursery rows. The season controls propagation a good deal of all the above. The soil should be closely pressed to the bottom of the cutting at all times.—CHAR. WRIGHT.

Oliver Landreth, aged 64 years, head of the firm of D. Landreth & Sons, died suddenly on Sunday evening last, November 21, of heart disease.

James B. Spaulding, president of the Spaulding Nursery and Orchard Company, died at Riverton, Ill., November 11, aged 73 years. He was a native of Massachusetts.

have yet seen, possessing many features of practical utility. It can be used for carting about heavy tubs and plants; it can be used as a leaf wagon, by fixing on a handy light crate which is specially constructed for the purpose. It can also be used as a carriage for the water barrel, spraying apparatus, or as a fire extinguisher, for which last two purposes special mechanism is provided by the makers. Its construction and use in the latter capacities are explained by the accompanying illustration.

Underneath the platform of the regular lawn truck is placed, when desired, an air condenser, operated by a sprocket chain from the rear wheels. When the truck is in motion the condenser forces air into the steel tank, already nearly filled with water or spraying mixture. Any desired pressure can thus be obtained, either for spraying orchards, shrubbery, wetting lawns or driveways, washing off or cooling down houses or stables, or for extinguishing fires in two or even three-story buildings. A short drive will compress air enough to force ten barrels of water into upper story of a house, and the pressure once generated, the tank can stand till an emergency requires its use.

The wide tires (six inches) with front

one I wrote of was grown 15 years ago, just a hard-wooded cutting taken from an old St. George Rose, the cutting was taken in the winter, stuck slanting near a fence, and let alone for a year, then taken up and set against the west end of the house. After it was so badly frozen I took it up and set it near a fence at the north of the house, but I had to cut it back to near the ground; now the true St. George is about five feet high and blooms just as it and a lot of other St. Georges do, but the long shoots keep growing and branching faster than ever Crimson Rambler does; the foliage and tender growth are the same as in St. George, but so far there has never been a bud. I am going to let one branch go up in the pecan tree and let the others take the fence; perhaps it may bloom some time. St. George Rose is among our hardest and best blooming roses.—MARGARET E. CAMPBELL, La.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 12, 1896.

Commercial Cable) Florex, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

**Canadian Fruit** THE experiment of transporting tender Canadian fruits, such as peaches, plums, grapes, tomatoes, etc., to England by the cold storage system arranged by the Laurier administration, has been carried out, and although the results of the trial shipments have not been as satisfactory as had been hoped for, the degree of success attending the efforts is very encouraging indeed. The experiment has been looked forward to and watched with no small degree of interest by all Canadians, but more especially by those engaged in the pursuit of fruit growing for a livelihood. The possibility of competition with the fruit raiser of the United States is not a remote one either.

The first shipment of fruit on September 7, left the government warehouse at Grimsby, Ontario, where it had been previously chilled and packed under the supervision of Prof. Robertson, and proceeded in refrigerator cars to Montreal, there to be forwarded in cold storage by steamer Merrimac to London, via Bristol. Upon arrival at Bristol the shipment had to again be put in refrigerator cars for a five hours' journey to London.

This trial shipment consisted of 890 cases of Bartlett pears, Crawford peaches, grapes, and tomatoes, each case containing nearly a bushel and making in all two carloads. When the cars arrived in Montreal the cases were again examined

by Prof. Robertson and the fruit was found in excellent condition with the exception of a few peaches which seemed a little too ripe to start on so long a journey.

The condition of the fruit upon arrival was not what had been expected, however, the most of it, with the exception of some apples and pears, being a little over-ripe.

In the first place the Canadian packages lacked sufficient ventilation. They were also too heavy. The California fruit when packed at New York is treated quite differently from the Canadian fruit at Montreal. The packers at New York have a space between the walls of the compartments and the crates, and spaces also allowed about each crate for air and ventilation. The compartments are not filled to their utmost capacity either, and as a consequence the California fruit arrives in the best of condition. As a result of the reports from England subsequent shipments from Canada have been far more satisfactory. Reports of three separate shipments state that the fruit arrived in good condition with the exception of grapes, which though apparently in sound condition, drop from the stems immediately they are handled. The tomatoes sent arrived in excellent condition, but they were too large for the British markets.

While this experiment was being made under the supervision of government officials, another was being made by fruit growers at Burlington, Ontario, a small town about 25 miles from Grimsby. The growers at this point did not have the advantage of a warehouse, which to previously chill the fruit before shipment. If advantage it had, but they met with a far greater degree of success.

An interesting experiment was made in tomatoes. Green, quarter-ripe, half-ripe, and three-quarter-ripe fruits were sent. Those three-quarter-ripe arrived very ripe, but not sufficient to burst the fruit. Those half-ripe were in excellent condition, and those one-quarter-ripe were very ripe indeed, but not wet. Half-ripe tomatoes are therefore recommended for shipments.

That the Canadians intend to push the industry admits of no doubt, and again we urge upon our growers the necessity of strict grading and honest packing, if they intend to hold their own in the markets of the world.

We call special attention to the prospectus for 1898, which appears in the advertising columns.

Dr. A. H. Kirkland, Amherst, Mass., of the Gipsy Moth Commission, reports that Paris green, not having proved sufficiently effective for their use, they had by experimenting found arsenate of soda to serve the purpose better. This was now coming into general use. It being cheaper and less likely to do injury. The necessary substances are to be had in card boxes, arsenate of soda at one end, acetate of lead at the other, in proper quantity, each to be dissolved by itself and the two then poured together. The cost of this in quantity, as used by the Commission, was 7 cents a pound, whereas the Paris green costs 12 cents. In the war against the gipsy moth about half a ton was used daily.

The officers for next year's meeting of Economic Entomologists, to be held in Boston in August, 1898, are: President, Herbert Osborn, Ames, Iowa; vice-presidents, Lawrence Bruner, Lincoln, Neb.; and C. P. Gillette, Fort Collins, Col.; secretary and treasurer, C. L. Marlatt, Washington, D. C.

## Experiment Station Tests.

To the Editor of American Gardening.

IN AMERICAN GARDENING of November 18, page 774, I notice an article on experiment station tests, by B. F. Smith, which I was indeed glad to see, as it touches a subject that is of vital importance not only to strawberry growers, but to all gardeners, both private and commercial. What is true of strawberries and the way they are tested is true also of other plants.

How in the name of common sense can any one expect to have a new variety of any kind of plant accepted as good or otherwise when tested as in Mr. Smith's article? While any one may have fair success with a few plants of a given variety, yet when a large grower takes that same variety and gives it the same care as others, he may make (as has indeed been the case) a complete failure of it. It is then and not before that the need of the plant is found out.

It always has seemed to me that in most cases there is harm rather than good done by the experiment station, and both time and money are wasted. It seems to me that the best experimenting is done not by the station, but by the grower, and why? Simply for the reason that while experimental work is all right and we all must do more or less in that line, yet, if it be not done in a practical manner mixed with little common sense, it is worse than useless.

I think there are many gardeners and others who agree with me in this from sad experience; if we had more good practical common sense work and less of this simple experiment work it would be better not only for the large grower, but for the public in general, for what practical use can we get from the reports given out by the stations? They are like the seeds sent out by the government—most of them no good; that is what I found in both cases.

Let us have more practical common sense work and less of what I call guess work and nonsense.

FRED. C. ROSE.

To the Editor of American Gardening.

Mr. Smith (page 774) hits the nail on the head about experiment station reports. I have had the same opinion for some time.

We all know Crescent is one of the most prolific of strawberries; Bubach is large; Warfield firm, and Haverland a strong grower. Now if the new candidate is compared with these and is better (as all new seedlings are supposed to be, at least by the originators), we know what to look for.

Experiment station reports don't go as far with me as they do with a good many. The Van Deman strawberry had not a single unfavorable report from the stations, but after fruiting it a number of years, I found no bigger humbug in the list. The same might be said of numerous others. It's a good deal like the list of fruits recommended by the American Pomological Society for the several states. The grower, who relied on this list would be a "back number" sure.

Almost any up-to-date fruit grower must test most varieties himself to know just what he needs most. When some one tells me a peach ripens with a ahead, or later than, Mountain Rose or Oldmixon, I know whether I want it or not, but if it is said to ripen in New York August 12, or Georgia July 15, I am all at sea. Why not describe it in comparison with a standard variety? For instance: large as Crawford's Late, same shape, color yellow, red cheek, freestone, ripens a week later, etc. Then the public would know what to expect, for any peach grower knows Crawford's Late and he knows whether such a variety would suit him or not.

Apologies of Mr. Berckmans' Ever-bearing peach. I bought some twelve years ago an Ever-bearing apple of Mr. Lindley, of North Carolina, and when it bore I was delighted (?) to find an old friend, the Red June. C. WRIGHT, Del.

## THE QUESTION BOX

That questioner much shall learn much.—BACON

Readers are invited to forward particulars of any difficulty or perplexity that they are encountered. If the question be one of general interest it will be inserted in this column, so that other readers who may have information to impart can assist their brethren by recounting their own experiences. Questions of a purely individual interest will be replied to by the Editor under the head of Short Answers.

Questions submitted in this department will receive the full attention of the staff of AMERICAN GARDENING and when desirable will be answered editorially.

All communications for insertion should be clearly and concisely written on one side of the paper only, and addressed to the Editor of AMERICAN GARDENING, P. O. Box 1697, New York City. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query or answer is sent, each should be on a separate piece of paper.

Answers should always bear the title of the query replied to and the page on which it appeared, and our readers will greatly oblige us by advising, as far as their knowledge and observations permit, the correspondents who seek assistance. Conditions, soils, and means vary so infinitely that several answers to the same question may often be very useful, and those who reply would do well to mention the localities in which their experience is gained.

**Important to Querists.**—Correspondents must look through the whole of the paper to see replies to their queries. Answers cannot always be given the week after the queries are received, but there is as little delay as possible in dealing with them.

**Cash Prizes** will be given for the best set of answers each week. Payment to be made monthly.

### Cinerarias Dropping Foliage.

I have a number of Cinerarias raised from seeds sown in August. The plants look vigorous, but I have noticed that one or two older leaves damp off; and as they are quite free of aphids, I am at loss to explain the cause. The temperature of house varies from 80 degrees at day to about 40 degrees at night. Please explain possible cause and remedy.—G. SCHRETZLMEIR.

### Rhubarb in Cellars.

Having seen a small paragraph in your paper treating on the English people raising the plant in their cellars, I became interested, and ask if you will please give me their method.—MATILDA J.

### Turnips Are Bitter.

The turnips we have grown this season are very bitter. Would growing near to or near radish cause them to be bitter? They are of good size and look perfect, but not fit for use. Can anyone suggest a remedy to overcome the bitter taste?—C. B. W.

### Wintering Cannas and Caladiums.

I have a lot of Canna and Caladium bulbs which I have grown on my lawn. I have had no experience in keeping these through winter. Have heard that they rot freely. What are the directions for keeping these bulbs through winter?—G. JOHNSON.

### Begonia Rubra.

I have Begonia rubra that grows a tall, cane-like stalk. I have cut off two this season; have one now three feet tall. Should they be cut off or left to grow, and what will be the result if they are left to grow?—W., Wis.

### Primroses and Violets from Seed.

What is the best way to raise English primrose (Primula vulgaris) from seed, also Violets?

Can I obtain blooming plants (from seed just set) for next spring.—HARRISON AMATEUR.

### Disease of Egg Plants.

Our egg plants were badly affected with a disease the past season. It appeared like a blight; the leaves would turn yellow, then brown, wilt, and die; the brown part would dry so that it could be crumbled. There was no trace of any insect or fungus upon them, and they were growing in well-enriched ground, as about half the plants made a splendid growth, with fine eggs. Did any one else suffer similarly, and what are the cause and remedy?—WILLIAM.

### How to Prevent Club Root.

What is the best preventive of club root in cauliflowers?—E. W., Conn.

### When to Prune Wistaria.

Should a Wistaria vine be pruned immediately after the flowering season, or during the winter months, to insure best and largest flowers, the following season?—W. M. E., Conn.

### Should the Runners Be Cut Off?

I have some 200 Marie Louise Violets in cold frames. They were planted from 10 to 12 inches apart. The plants now touch each other and are blooming. Should the runners be cut off?—G. H. B.

### Gladolus for Forcing.

Kindly name the best Gladolus adapted for early spring forcing.—HOOVER & MOORE.

### Colorado Fruit Paper Wanted.

Can you give me the name of a good paper on fruit growing in this state?—C. AUSCHICKS, Col.

### Short Answers.

(To P. J. McL., Canada)—Your propositions are taken under advisement.

(To W.)—There is no necessity to cut off the shoots of your Begonia. You may do so if you like; it is merely a matter of convenience.

(To Subscriber)—It is not possible to tell you what temperature to maintain unless you tell us what plants are grown and for what purpose.

(To R. B.)—Chrysanthemum Golden Wedding is prone to take on the disease of which samples were submitted. Propagate from sound stock, and if the trouble appear, withhold water and keep the soil open.

### Names of Plants.

(To Sparkhill, N. Y.)—1. Euonymus europaeus; 2. E. alatus.

Scene: One of the largest commission houses in New York City. Enter Long Island farmer with sample of turnips. Farmer: "I have a carload of these handsome turnips. Can you sell them for me?" Salesman for commission house: "No! they wouldn't bring the freight and cartage, let alone commission and cost of sacks. We can sell nothing but Canadian turnips." L. I. Farmer: "Why, I thought the tariff was going to keep out potatoes, turnips, and other vegetables." Salesman: "There's where you are mistaken; our customers will have Canadian turnips or none. The price is a secondary consideration. Personally, I feel the same way too. I would rather pay a dollar a barrel for Canadian turnips than have the ordinary white or yellow turnips as they are grown in this section of the country for nothing." L. I. Farmer: "Well, I can at least feed them out to my cattle. Another year, however, I shall plant carrots or some vegetable having a greater feeding value than the flat varieties of turnips."

## Mr. Jerolaman Answers His Critics.

I write from my winter home in North Carolina to reply to some recent communications which have appeared in AMERICAN GARDENING.

As it is always good form to answer strangers first, I will commence with Mr. M. W. Smith, who wishes to know how much good wood ashes and other phosphates it would take to replace manure. If Mr. Smith means manure from horses, cows or sheep that have been fed on grain of any kind, corn, oats, or rye, and on good hay, timothy or clover, then in that case there are no ashes or commercial fertilizers on or under the earth that will ever take the place of such barnyard manure as I have described. But if you mean manure from cattle or horses that have been fed on cornstalks and salt hay only, as is often the case, why then ashes alone will excel all such manure.

The only way to put it on strawberries after the plants are set out is as follows for row 100 feet in length: Take a tin or any kind of pail that will hold 12 quarts, and with the hand scatter the ashes gently on each side of the row, taking care that you get but little, if any, on the crowns of plants. Remember 12 quarts of unleached ashes is sufficient for 100 feet, and that pure ashes are nearly all potash, also that nearly all commercial fertilizers, except bone, are composed of more or less potash.

You can get ground bone, mix it with equal parts of lime and ashes; those two ingredients will thoroughly dissolve the bone and all plant roots will absorb it at once, but this is a costly fertilizer.

Why? Because it does not give strawberry plants that which they need, and although 12 quarts will go 100 feet, yet it is dear at that. You cannot get enough on them, without burning the roots, to do them much good. With any kind of phosphates, if you put on enough to do good, it will burn the roots, and with less you cannot find any benefit.

I have often tried bone alone and found but little if any benefit from it. It will make large, dark, and rank foliage, and less fruit is my experience, and unless bone is dissolved in ashes or lime, it will take at least one year before you derive any benefit at all.

In this connection I wish to state to all that ashes, lime, hen manure, and ammonia are all caustic manures and as nearly all our commercial fertilizers are composed of more or less potash and ammonia, I put nearly all of them in one class and call them "burning" manures. I know that not only my pocketbook but my plants have been burnt by them.

But the fertilizer man will tell you that I am ignorant, and do not know how to apply it. I think he is right too, for I have often felt that some one ought to have knocked a little sense into me when I bought his fertilizer. I do not believe he knows how to apply his own fertilizer; he may know all about stimulants, but when it comes to applying them to land, it is altogether different from when applied to man!

To Mr. Henry Snyder, of Maryland, and also to Mr. Wooster, of Maine, and to several others as all of you have nearly the same desire, to wit, to learn just how much I know about strawberry culture (and also how little, I suppose), and to all readers of AMERICAN GARDENING will state that man, according to his knowledge or his ignorance, and water according to its stillness will always find their own level among intelligent men.

Some say that wise men keep their mouths shut, but I have often known fools to keep theirs shut too—because they did not know anything to speak about. To you all together I will state that one of my principal objects in coming South was to get some rest, and write a book on Strawberry Culture; this I am doing at present as fast as I can.

I can assure Mr. Snyder also that I will not charge the cost of producing one crop to any other crop, for instance, that

If it takes 50 or 60 loads of manure to produce a first-class crop of potatoes at a cost of \$1.00 per load, that is \$60 when put on, and it was actually necessary to put this amount on in order to produce a first-class crop; then it would not be fair or even honest to charge it to the next crop of some other kind, because if my crop of potatoes was first-class (full crop), then I ought to get my pay from that crop for the labor and fertilizer put on it for that purpose; in other words render unto him that which belongs to him. Do not be afraid, my dear sir, that I will not charge for the picking, or selling, fertilizers, etc., that it costs to grow a first-class crop of strawberries in order to show to the world that I can produce a good first-class crop of strawberries for less than any other crop that grows out of the earth.

Now I will repeat my statement, that is, I propose to show and convince all that I can produce a first-class crop of strawberries at a less cost per acre than any other paying crop, such as wheat, rye, oats, corn, potatoes, and I will not except turnips (rutabagas).

H. JEROLAMAN.

## The Window Garden.

### Blue-flowered Bulbs.

Among those grown have been the Camassia, the Chionodoxa, the Tritileia, and Scillas, beside the Hyacinths and the blue and purple-toned Crocuses. One needs say little about the Hyacinths. Aside from these, those wholly satisfactory have been the tall Peruvian Scilla, known as Scilla Clusi, and the Tritileia. Puschkinia is very good, but hardly to be relied on at all times, as there is none of the happy-go-lucky spirit that suits all conditions in its nature. It seems a pity that not all are wholly good, since the most beautiful blues known in flowers appear in some of these bulbs.

### Cheapness of Bulbs.

There are so many who consider the high prices of bulbs a bar to their use, that it will do us good, perhaps, to look at the low prices for a little. A standard firm, known the country over, offers mixed Hyacinths at 40c. a dozen. A number of named sorts of Tulips are but 20c. a dozen. Narcissus poeticus, one of our loveliest flowers, is 15c. a dozen. Freesias are the same, and indeed we have seen them offered this season at 10c. a dozen. There is nothing finer. Who says bulbs are too high?

### The Pretty Anthurium.

So well has it behaved, this Scherzerianum, during the almost year and a half it has been on trial, that other of its near relatives will be procured as soon as possible, in order to see if they too are so friendly in disposition. No insect has ever touched it, not a leaf has yellowed, not a flower blasted. It has been in bloom nearly two-thirds of the time, and the bloom is vivid in color. The leathery leaves are the most easily sponged of any in the collection. The blossoms, while few, are very lasting. How many other plants have such a surprising list of good qualities for the common living room?

### Outside Plants Brought In.

Those that were transplanted, not too early, and left on the ground, just where they grew, for two weeks before removal to the house, have done the best. A late plant of one of the new Scabiosas is growing on well, and these are notably difficult to transplant. Several plants of the novelty, Helianthus cucumerifolius, in the finest size to grow on, have been hardly stricken with mildew, the only ones so troubled. They will be useless. This is a disappointment, as they were thought most promising.

### Amaryllis Two Hints.

An expert grower of these favorites is particularly careful not to try to hurry them by giving water until they show that they want to grow. Another point to note is that many a failure is due to keeping the bulbs too cool during the

resting season. In the greenhouses they are often put away under the benches, but home growers sometimes store them away in unheated closets. They need good ripening in the sun, and rather warm quarters thereafter.

### The Satisfactory Plants.

Thus far in the season, the most delightful decorative plants in the experimental collection have been the Gynura mentioned several times, Grevilleas, Asparagus Sprengeri, Anthurium Scherzerianum, and, among those lately procured, the Boston Fern and the new Abutilon Savitill. The last two have grown on as if they had never known removal from the moist warmth of the greenhouse. The Asparagus grows daily better, handsomer, larger, and manifests not the slightest concern as to sunshine or warmth. It is grown cool, with fair light and little direct sunshine.

### Overcoming Adverse Conditions.

There is little question that the best way to deal with plants to which the conditions at our command are not suited is to leave them off our lists. Yet this is really running away from the enemy, and there are those whose temperaments urge them to battle. They would rather fight for success than to have it without struggle. For such, there is a way of getting around some obstacles. If there is one thing in the surroundings which is unsuited to a particular plant, special care in all other respects will be a great aid in overcoming the trouble. For instance, special care in admitting copious supplies of fresh air, and in showering such plants as do not plainly indicate their dislike of showering, may keep in fair health those which are much out of their element in a dry atmosphere, or in too great heat.

### An Indoor Chrysanthemum.

The comparatively new variety known as Maud Dean, is the only sort we have grown on in the pot throughout the season. It has proved very pleasing, even without the best of cultural care. The color lights up very prettily at night, and the bloom is of rather good size and form. It will last a week or two beyond the Thanksgiving season.

MYRA V. NORRIS.

## The Henry Strawberry.

Arrangements have been made whereby a bountiful supply of these plants will be ready for spring delivery to subscribers and agents, and in this connection we beg to call the attention of our readers to our generous offer of these plants in another column. We do not think that a more liberal offer has ever been made than the one now advertised, whereby the agent or worker sending us in a club of ten new names, at \$1 each, becomes entitled to 100 Henry Strawberry plants, while five plants will be sent postpaid to each person in his club. This offer will not apply to a club of less than ten. It may be a very long time before such an offer of such a plant can be made again. The wonderful success which has accompanied our premium offer this fall, in the short time at our disposal to advertise it, leads us to believe that the orders for the Henry Strawberry next spring may exceed all anticipations; however, we have planned for a large supply for delivery and trust to be able to meet all demands upon us. Mr. Jerolaman's series of articles is now being placed in pamphlet form, and copies will be mailed free to all who desire to use same in the canvas for new subscriptions.

All the premium Henry Strawberry plants due to date, have been shipped, except where a request has been made to hold them till spring, and judging by the unsolicited acknowledgments received, they are giving immense satisfaction. In order to reduce weight and hinder excessive transpiration some of the leaves are cut off before shipping, this is especially beneficial during a hot spell, and readers can rest assured all is done for the best.

## The Bee Keeper.

### Timely Topics.

Now is a good time to clean up all rubbish around the hives, allowing no harbor for mice, skunks, etc., for they are enemies of the bees.

The shade boards and other implements not in use now should be stored under roof.

The worst thing you can do with your honey is to send to a commission merchant who has no trade for it and will sacrifice it just to get rid of it.

The best you can do with the surplus you have is to put it up in the finest shape, make it look appetizing, then sell it to your neighbors and at your neighboring grocery. If you will do the right thing they will want more next year.

Do any of your hives need paint? No better time to give them a coat than now before the weather gets very cold.

The covers of every hive should be waterproof. See to this now. Tin is the best, but putty and paint do fairly well.

If you pack your bees for winter, don't use for the purpose anything damp. Dry wheat chaff is the best. Fine excelsior is good. Pine sawdust or planer shavings are also good if perfectly dry. The earlier you pack the hives the longer time the bees have to seal up the covers and close the draught holes.

Have you any wax scraps? Melt them up in plenty of water. The wax will float on top and cool. A few meltings will purify the wax of all impurities.

Use honey in your tea to sweeten it. It tastes good and is healthier than sugar.

Honey is a good remedy for catarrh, one teaspoonful every 15 minutes, taken warm for a few hours will give relief.

Honey and a decoction of sage leaves is a splendid remedy for sore throat.

Very often honey can be substituted for sugar in receipts in cook books. Try it on your strawberry shortcake.

Children would rather eat bread and honey than bread and butter, and honey is the cheaper and will go much further and is more healthful.

Take good fresh whole milk, break light wheat bread into this, and pour a little honey over it—a dish fit for a king.

Have you a poor quality of honey, use it for vinegar. It makes good vinegar. Use one and a half pounds to the gallon of water. It will require about as long for it to ferment and make good vinegar as does cider.

Beeswax and salt will make your rusty flatirons as smooth as glass.

Honey should be kept dry and warm. It readily absorbs moisture and sometimes ferments. If the temperature gets too low it will crystallize or candy, and if in the comb will crack the capping, causing leaks.

If your extracted honey candies, warm it slowly and it will become liquid again. Too much heat will spoil the flavor.

Tin cans are by far the best package to hold extracted honey. The regular 60 pound jacketed trade can is the ideal.

If you buy early your supplies for next season, you get a big discount off, often 2 per cent. per month.

Inquiries for further information about bees or honey are always in order.

L. W. LIGHTY, Pa.

## Our 1898 Art Calendar.

This beautiful gem of art, it would seem, is destined to find great favor among our subscribers, and the orders for it are now coming in rapidly. We still have a good supply in hand, but in order that all of our friends who want it may feel secure they will receive theirs we would advise early applications to be sent us. For particulars as to how it may be obtained, see advertisement.

## PRIVATE GARDENERS.

### Appointments and Doings.

Gardeners and others knowing of recent appointments and movings are requested to forward particulars of the same for publication in this column. No charge is made.

Thos. Proctor, formerly gardener to Mr. H. F. Cook, Sag Harbor, N. Y., has been engaged to take charge of the gardens of Mr. W. Jennings, Cold Spring Harbor, N. Y. He enters on his new duties Dec. 1.

### Cycads and Palms.

I appreciate your report of the Port Chester Flower Show, page 782 and 783, but there is one passage in it, which reads as follows: "The last-named (Gustave X. Amrhy) secured first for best Palm, showing *Zamia horrida* (which, however, is not a Palm at all.—En.)"

I wish to tell you that the "last-named" will never make any mistake in matters of botany, and exhibit a *Zamia horrida* (Cycadaceae) for a Palm. My first prize for best Palm was for a *Kentia Belmoreana*, and my *Zamia horrida*, of which I am very proud, was shown as Cycadaceae, taking the first prize.—GUSTAVE X. AMRHYN, superintendent to Jas. W. Quintard.

### Auction Sales.

Roses and other imported stock are now being offered in the New York sales-rooms. The increased tariff has this fall had the effect of reducing very much the quantity of this class of stock, however, and involves the necessity of the bids for all Roses being started above 7c. each, and buyers hardly know what to make of it. The average figures run from 8c. to 10c. each.

### A Plant Market.

A movement is on foot to establish a permanent plant market in New York City. This is something that is badly needed, and it is to be hoped that the scheme will be perfected.

### Short Hills, N. J.

On Thursday, November 11, the American Bulb Co. purchased from James R. Pitcher all the greenhouses and real estate of the old firm of Pitcher & Manda, used by them for growing exotics. This comprises what is known as the lower range, 20 houses (about 50,000 of glass). This famous establishment, known all over the world as the United States Nurseries, has been re-christened the United States Exotic Nurseries. The specialties of the new firm will be Palms and Ferns, special attention being given to *Adiantum Farleyense*. The members of the new firm are for the most part former employees of the old concern.

### Lecture on Violet Disease.

At the meeting of the New Jersey Floricultural Society to be held on Monday evening, December 6, at 8 P. M., in Decker's Hall, Main street, Orange, N. J., a paper on the Violet disease will be read by Dr. Walter Dodge, who has made a bacteriological study of the disease. The paper will be followed by a general discussion on fungoid diseases and remedies. All interested are invited to attend.

### Merion Gardeners' Club.

For some time past there has been a desire to start an organization in the vicinity of Philadelphia, Pa., and it is as last a fact, as the outcome of the Chrysanthemum show held at the Merion Cricket Club grounds at Haverford, about eight miles out from Philadelphia, Pa., at which the principal exhibitors have been private gardeners from Haverford, Ardmore, Bryn Mawr, Rosemont, and Villa Nova. All of these places are in the township of Lower Merion.

On Wednesday, November 17, a dinner was held at Dirigo Hall, Ardmore, Pa., those attending being the exhibitors at the late Haverford show. About 60 gardeners were present. John G. Gardner, of Stoke Pogis Nurseries, Villa Nova, Pa., was superintendent of the exhibition, and presided, and after dinner the Merion Gardeners' Club was organized. A committee composed of John G. Gardner, chairman, George M. Hay, gardener to S. H. Austin, Esq., Haverford; Chris Benz, gardener to Allan Wood, Jr., Esq., Conshohocken; Jos. Hurley, gardener to J. M. Rhodes, Esq., Ardmore, and William Fowler, gardener to Mrs. Chas. Wheeler, Bryn Mawr, was appointed to draw up a constitution and by-laws. All those present put down their names as charter members. The purpose of the organization is to hold monthly meetings at which papers will be read. The movement is a good one and will, no doubt, result in promoting comradeship among the large number of private gardeners in the locality.

### Philadelphia, Pa.

At the regular monthly meeting of the Horticultural Society on Tuesday last, the Clark premium for collection of seedling chrysanthemums in pots was awarded to Robt. G. Carey, gardener to Thos. C. Price, Esq., who exhibited some very promising varieties. He also staged some flowers of a new white named Robt. G. Carey, of the Japanese type, which forms a perfect ball—evidently a good thing.

### New York.

Owing to the exhibition at the Waldorf-Astoria, the regular monthly meeting of the Gardeners' Society was postponed till Saturday, November 20. On the evening of that day there was an attendance of thirty-five at 64 Madison avenue, and several candidates were nominated for active membership. John Scott, Brooklyn, and C. Gloeckner, care of J. M. Thorburn & Co., were elected as associate members.

John Scott exhibited a grand plant of *Eucharis amazonica* with 22 spikes, averaging five to eight flowers each. The plant showed remarkable vigor and the individual flowers were unusually larger.

Under the head of new business a protest against the non-award of the prize on his collection of Roses at the recent exhibition was made by A. A. Taaffe, Irvington, N. Y. He stated that he was the only exhibitor, that he staged eight vases of Roses, and that his entry number was attached to his exhibit. He therefore claimed the Morgan cup. After some discussion on the judges' report, it was unanimously decided that the first prize for the best collection of Roses (a silver cup valued at \$25, given by Mrs. Pierpont Morgan) be awarded to Mr. Taaffe.

Other awards and decisions were discussed, but no alterations were made.

### Nomination of Officers.

The following were nominated, and owing to the fact that no other candidates are standing against them, all others having withdrawn, they of course will be elected in due course. For president, W. Scott, gardener to T. C. Eastman, Tarrytown, N. Y.; vice-president, A. Welsing, gardener to Mrs. Erhardt, Waverley avenue, Brooklyn; treasurer, Robert Angus, gardener to Major R. E. Hopkins, Tarrytown; secretary, Wm. Bartholomae, gardener to W. B. Isham, Riverdale, New York City; Executive Committee, R. Brett, F. R. Pierkovsky, W. Anderson, John Shore, A. A. Taaffe, C. Webber, W. Sage, and A. J. Wengerter.

The manager of the late exhibition, J. H. Troy, stated that the "total receipts were \$2,310, expenditures \$1,560, leaving a total of \$750 to be given to charity." Several exhibitors at this juncture asked for their expenses of getting their exhibits to and from the show, stating that such had been guaranteed them by the promoters, but as this matter had been overlooked and no expenditure of that kind provided for in the final distribution, there were no funds left for the purpose.

## A Poultry Encyclopedia.

THE POULTRY KEEPER, edited by P. H. Jacobs, one of the best informed men of the age on poultry subjects, and who is aptly termed a walking poultry dictionary, has published four large pamphlets, covering every subject connected with the feathered tribe, which it entitles ILLUSTRATORS Nos. 1, 2, 3 and 4. The series constitute a veritable "POULTRY ENCYCLOPEDIA," covering the ground so completely that by the aid of the "Four Illustrators," and the regular monthly visits of the "POULTRY KEEPER," the reader can glean all the information necessary to become a successful poultry raiser.

You could not get any similar series in the whole world, even for \$50 each, for they do not exist. Were they given in regular book form with elaborate binding and colored cuts you would think them easily worth \$5 each, but what is wanted is not elegant printing, so much as valuable information that you can make use of. They have cost much in labor and cash, but we offer the set for almost nothing. A partial list of the subjects treated is as follows:

ILLUSTRATOR No. 1.—Poultry Houses, Incubators, Brooders, Coops, etc. 25 cents.

ILLUSTRATOR No. 2.—Artificial Incubation, Raising Chicks, Testing Eggs, etc. 25 cents.

ILLUSTRATOR No. 3.—Poultry Diseases, Lice, Gapes, Moulting, Egg Eating, etc. 25 cents.

ILLUSTRATOR No. 4.—Judging Fowls, Description of Breeds, Mating, etc. 25 cents.

**\$1.50 Buys This: \$1.50**

For \$1.50 we will send American Gardening, (weekly) one year, The Poultry Keeper (monthly) one year, and the Four Illustrators, as above.

ORDER NOW.

AMERICAN GARDENING, P. O. Box 1897, New York.

NEW YORK PHILADELPHIA  
C. H. Ditson & Co. J. E. Ditson & Co.

Mention American Gardening when you write.

President Shore brought up the matter of associate members having no privileges such as to vote, also stating that there was but little inducement for them to become interested in the work of the Society and regularly attend its meetings. A suggestion was then made by John Fursey that the by-laws be amended to read that associate members be granted all privileges except the holding of any of the principal offices. J. I. Doulan strongly opposed the suggestion, stating that the privilege of attending the meetings, and meeting the boys should be ample compensation for the dues paid, and further, that for any associate member to expect more, he must have dishonest or mercenary motives. On the motion of J. M. Hunter, the matter was laid on the table and the meeting adjourned.

### New Bedford, Mass. Show.

A very meritorious exhibition was the result of the efforts of the Gardeners and Florists' Club this year. The handsome silver cup, offered by Mr. Frederick Grinnell, becomes the property of James Garthley, by his winning it again this year. This exhibitor put up a magnificent group of Chrysanthemums, occupying 40 square feet. William Keith, gardener to Thomas M. Stetson, Esq., exhibited a group, occupying 60 feet square. He won first prize. Peter Keith, gardener to Miss Julia Delano, had a grand Orchid display.

William Keith was first for 10 white blooms with Mrs. Henry Robinson; second for 10 yellow, with H. L. Sunderbruch; first for 10 bronze, with Col. W. B. Smith.

Other prize winners were: B. J. Conolly, of Taunton, for one vase of 10 white Chrysanthemums, the Queen, second; special exhibit of Chrysanthemums, Pitcher & Manda; yellow Chrysanthemums, Sunderbruch; six Japanese distinct varieties; six Japanese, three varieties.

Alex. MacLellan, of Newport, 12 Japanese distinct varieties, second; six Japanese distinct varieties, first.

J. Eaton, six Chinese, three varieties, first; one vase of 80 flowers, first.

A. B. Hathaway, 12 Japanese, first; six Japanese, three varieties, second.

S. S. Peckham, M. M. McCarthy, J. Stanley, J. W. Frazier, A. J. Fish, J. Eaton, Jr., R. H. Woodhouse, C. H. Waite.

### Toronto, Flower Show.

The eighth annual chrysanthemum show of the Gardeners and Florists' Association was opened in the Pavilion on the 10th inst. It was the best exhibition ever held here.

In class 1, section 1 to 6, Robert Gow, gardener to Sir C. Crsowski, took all the first prizes in most of the sections without any competition. His plants were fairly well grown and well bloomed, but were too tall to be really good, several of the plants in 8-inch pots being over five feet in height. The one specimen plant Lincoln was very well-grown and a credit to the grower. The best varieties shown among the pot specimens were Lincoln, Niveus, Golden Wedding. George W.

### \$100 Reward, \$100.

The readers of this paper will be pleased to learn that there is at least one dreaded disease that science has been able to cure in all its stages and that is Catarrh. Hall's Catarrh Cure is the only positive cure now known to the medical fraternity. Catarrh being a constitutional disease, requires a constitutional treatment. Hall's Catarrh Cure is taken internally, acting directly upon the blood and mucous surfaces of the system, thereby destroying the foundation of the disease, and giving the patient strength by building up the constitution and assisting nature in doing its work. The proprietors have so much faith in its curative powers, that they offer One Hundred Dollars for any case that it fails to cure. Send for list of testimonials.

Address, F. J. CHENEY & CO.,  
Toledo, O.

Sold by Druggists, 75c.

Childs, Mrs. Robens, and Helen Bloodgood.

In the classes for plants, single stems, and single flowers, there was lots of competition.

The cut blooms of chrysanthemums were all good. The vases of 20 and 25 made a fine exhibit. In the 20, one variety in a vase, Niveus took first prize, with Ivory second, and Mayflower third. The Mayflower were very fine blooms, but their dirty yellowish tint looked so bad against the pure white of the other varieties that they were quite out of it. In 12 blooms white, Queen was first, Niveus second, Ivory third. Good Mayflower were also shown here, but with the same result as above.

For the 12 pink, President Smith was the fancy; for 12 yellow, the best were Bonnaillon, with E. Dailedouze and Golden Wedding in the order named. In the best six white Niveus was the winner; six pink, Harry Balsley, with Mrs. Perrin close after them. Best six yellow Georgiana Pitcher was first; they were fine examples of that variety.

The collections of orchids were better than usual here, and they made a fine and interesting show on the table in front of the stage.

### Mount Kisco, N. Y.

The third annual show of the Bedford Flower Club, under the management of the Westchester County Horticultural Society, opened Tuesday, November 9, in the Mount Kisco Opera House and will continue until the following Saturday night. Much credit is due to Mr. Herbert Spavins, the superintendent of the show, for the artistic grouping of the exhibits and general decoration of the hall. Taken as a whole, this season's show is a decided improvement on the preceding two. The general average of both plants and flowers was better. The number of individual exhibitor was larger than ever before, and competition for the prizes was keen—especially was this true of the Bailey prize, which was awarded to J. D. Lang. Among exhibitors in the trade F. R. Pierson Co., Tarrytown, N. Y., made a fine display of palms and other plants not for competition. Doyle Bros. captured the silver cup for best collection of decorative plants. Herbert Spavins won the silver cup offered for best collection of ferns; also the prize for best araucaria. O. V. Roden obtained a certificate for best collection of geraniums, also prize for flowering begonias; A. L. Marshall, gardener to J. B. Dutcher, Esq., was also a very successful competitor, taking first for carnations, cannas, best specimen fern, begonia rex, and the silver cup for best six plants most suitable for house decoration.

### Providence, R. I., Show.

The Rhode Island Horticultural Society opened its November, or annual exhibition to the public Thursday afternoon, 11th inst., in Music Hall. Never in any previous year has there been such a full exhibit and so high a class of both plants and blossoms. The exhibits of potted plants were rather meagre compared with former years as regards number, but the standard of quality was much higher. In cut blooms the present exhibition was vastly superior.

Opposite the center of the stage was the display of Mrs. T. P. Shepard, consisting of palms interspersed with chrysanthemums, crotons, and other decorative stock.

One of the most attractive of the collections was that of the Park Greenhouses (J. G. Jensen). In the center was a round pillar some eight feet high, on one side of which was a solid bank of white and the other of yellow chrysanthemums, the former entwined with asparagus and the latter with hardy English ivy with respective interspersings of Scott and McGowan carnations. On the top of this was a large potted fern, over which hovered a pure white dove. Around this pillar were grouped palms, ferns, araucarias, adiantums, chrysanthemums, etc.

William Goddard (Alfred Powell, gardener) made a fine display of artistically arranged plants and chrysanthemums.

William E. Chappell showed a group of miscellaneous palms, ferns, and chrysanthemums.

There were really but three exhibitors of any moment in this class—Farquhar (acrae, of Providence; Robert Laurie, ewport; and Bernard J. Connolly, of ainton, Mass. In addition to the leading varieties, three particularly fine special exhibits of new chrysanthemums attracted attention. These consisted of vase of the Pennsylvania exhibited by Hugh Graham, of Philadelphia.

Mr. Laurie captured the much coveted special prize, a solid silver tea set, for the best six vases of blooms, with Mr. (acrae a close second.

#### Worcester, Mass., Show.

The annual show of the Worcester Horticultural Society was equal to its predecessors.

The principal exhibitors were F. A. Blake, H. F. A. Lange, W. E. Sargent, C. J. Thayer, Moses Brierly, Orpet of Lancaster, W. J. Wood, Mrs. Austin Ward, A. Loper, of Tewksbury, and Fred Madaus.

One of the most beautiful exhibits in the hall was that in the class calling for 12 cut blooms. The finest two were those of Mr. Lange and C. D. Thayer. In Mr. Thayer's were grand blooms of A. H. Fewkes and Major Bonaffon. These were especially large and their deep yellow color was particularly noticeable.

The show of carnations was extensive. C. W. Ward, of Queens, N. Y., had a large collection, comprising an immense Mrs. George M. Bradt, the bloom being a trifle over three inches in diameter; a beautiful pink variety C. A. Dana; Maceo, a very dark red, almost maroon; Maud Dean, Gold Nugget, which is almost a clear yellow, and New York, a very beautiful bloom of a darkish pink color.

The display of chrysanthemums this year was the largest and finest ever seen in this city. One of the members of the Society said that it was easily 50 per cent. finer than at any previous exhibition. The blooms were larger and handsomer and more varieties were shown. One of the finest of the absolutely new kinds was Red Warrior, a large bloom with reflexed petals, and of a deep terra cotta hue. It was shown by Mr. Lange. But for the most part the specimens were of old standard varieties.

#### Syracuse, N. Y., Show.

The average quality of the display here on Nov. 9, was not quite up to last year's standard. In the large specimen plants the blooms were good, but the foliage was deficient, and the shape of the plants was not so good.

P. R. Quinlan Co. had a large central display of decorative plants interspersed with vases of cut flowers, among which were two exquisite vases of Major Bonaffon. Grove P. Rawson, of Elmira, N. Y., supplied an artistic novelty in the shape of an immense floral picture, with a frame of ivy leaves; in the center was a pitcher of Chrysanthemums and sprays of native Prunus. The special prize for native Ferns brought out some interesting and instructive exhibits. M. H. Ochsner, of Eastwood, being first with 25 varieties, all labeled and nicely staged.

The competition for the prize offered by the makers of the "Yellow Fellow" bicycle was naturally the premier attraction, and brought out seven competitors—Grove P. Rawson; Nathan Smith & Sons, Adrian, Michigan; A. McLellan, Newport, R. I.; E. G. Hill & Co., Richmond, Ind.; and Walter Menelly, George Ham, and L. E. Marquisee, of Syracuse. The competition was very keen. The three chosen for the final were the exhibits of Mr. Rawson, Nathan Smith & Son, and E. G. Hill & Co., Mr. Rawson's being ultimately chosen by the representative of the company. The pedigree of the winner is Golden Gate seed parent, and Niveus.

In cut blooms for 24 varieties, one bloom of each, Nathan Smith & Son took first with a fine level lot. The varieties were Sunstone, Lady Playfair, Mrs. Geo. A. Magee, Vivand-Morel, Mrs. J. G. Glessner, Minnie Wanamaker (a grand bloom), Golden Gate, G. W. Childs, Mrs.

## A FARM PAPER

ought to be as reliable a guide to the farmer as the dictionary is to the student. If your land does not produce well; nor your animal thrive; nor your tree or vine bear fruit, the farm paper should find the reason and point the way to better results. The

Jerome Jones, Iora, The Queen, Mrs. V. C. Egan, Nyansa, Mayflower, Western King, Reine A. Angletterre, Philadelphia, Margaret Jeffords, Silver Cloud, Melinda, Col. W. B. Smith, Mme. Philippe Rivoire, E. Dailledouze, and Admiral Avellan.

In the prizes for six vases, six varieties; one vase yellow, 12 blooms; one white ditto; one pink ditto, there was no competition against L. E. Marquisee. The first mentioned consisted of Gladys Vanderbilt, Hicks-Arnold, Philadelphia, Thomas Emerson, Mutual Friend, and Sunclad. For 12 yellow he staged Peter Kay; for white, Mayflower; for pink, Maud Dean. The last two were grand, the best of a very fine exhibit.

In the class for 24 single stem and bloom not larger than six-inch pots, C. E. Phillips was the only competitor, but he certainly merited the prize. The varieties were: Major Bonnafor, Pitcher & Manda, Peter Kay, Mrs. Geo. Magee, Mrs. Geo. West, John Shrimpton, Jayne, Georgiana Pitcher, V. Morel, Lincoln, A. H. Fewkes, White Boehmer, The King, Helen Wright, Maud Dean, Minnie Wanamaker, Eda Prase, Mayflower, Golden Wedding, Niveus, Elma O'Farrell, Philadelphia, and a white sport of Vivand-Morel. Mr. Phillips also took first for the largest bloom on exhibition with Peter Kay grown in a six-inch pot.

In the gardeners' class the competition was chiefly in large specimens. The amateurs showed up well, Stephen Mowry and C. E. Phillips staging fine cut blooms.

For collection of Roses Peter Crowe, of Utica, was first. For best three vases, L. E. Marquisee led, Mr. Crowe's second being very close indeed. The latter exhibited a vase of the Rose Christine de Noe. The style is after Papa Gontier with a deeper color.

### St. John N., B., Show.

The Horticultural Association of St. John held its annual display of chrysanthemums in the Mechanics' Institute assembly rooms on November 4 and 5. As the show was held a week earlier than in previous years, it did not bring out all the exhibitors who would have made displays had the plants been in fit condition for the show. But what was lacking in quantity was made up in quality, there being some of the finest bloom ever seen in the "City by the Sea."

The Horticultural Association made its usual grand display of plants and cut blooms, and took up the whole space of one of the two large rooms. The plants were not as fine as usual; but the flowers were excellent, all being fine specimens. Some 250 cut blooms were staged.

John Crulshank made a creditable display of plants. His 30-foot group was tastefully arranged. Some of his blooms were very fine.

Herbert E. Gould, of Sussex, also made fine exhibits of cut blooms and plants. He captured all the prizes in plants, there being no competition in this class.

Wm. McIntosh, gardener to Joseph Allison, Esq., made a very pretty display of foliage plants, which added much to the show.

**The Poultry Yard.**

**The Silver Wyandotte.**

It is nearly ten years since so prominent a judge as B. N. Pierce considered the Wyandotte a fowl of such importance as to deserve a volume to itself; which volume appeared under the title of "Wyandotte Culture," and dealt almost wholly with the Silver Laced variety, the White and the Golden Wyandotte being not then admitted to the standard. As to the Blacks and Buffs, who had even heard of them? There was even a chapter on "Growing Wyandottes," and the statement was made that never in the history of fowls had a new breed sprung up and gained in popularity as had the Wyandottes, meaning, of course, the Silvers.

Since this was written, the value of the Silver Wyandotte has become even more fully understood, and its devotees have been numerous and staunch. But the novelty of the newer varieties, the extreme beauty of the Golden, and the special adaptability of the White Wyandotte to broiler needs have a little crowded aside the great original sort. This does not indicate that it is one whit less valuable or less popular than before, but only that there has been more talk about the others.

First and forward, the Silver Wyandotte is valuable as a prolific producer of eggs. As a producer of meat for the table which excels in juicy tenderness and in the proportion of breast, it is noted. A characteristic by no means to be despised is that of fattening easily for the table at any age, from ten weeks up. The yellow skin and legs are attractive, and the bones are comparatively small. Some one has stated the value of the breed in this way: "If you want the maximum number, both of eggs and pounds of flesh at the minimum cost, you can find it in the Silver Wyandotte." This is a fair and temperate statement, not to be placed by the side of those ultra enthusiastic affirmations that the initiated smile at it, and do not think worth while to contradict because few believe them.

As in all breeds, it will be found that the Silvers differ much in different hands, and it is well to look carefully before buying. From one show, it was reported that a pen of birds of this breed, of full age, averaged but five pounds. Pullets of the breed, shown by another, averaged six pounds. These hens must have been thrown out of competition for prizes, for the standard weight of hens of this breed is six and a half pounds.

Certain faults, generally due to the make up of the original specimens, are prone to crop out in every breed, to the annoyance and often to the despair of the breeder. In the Silver Wyandotte, feathers on the legs have been a frequent annoyance; also single combs, lop combs and crooked backs and tails. Yet strains differ so much that we obtained from one breeder a lot of birds which never, I think, gave us a specimen showing either of the defects first mentioned. And this in the earlier days of the breed, when these evil tendencies should have been far stronger than now.

The handsome rose comb, oval over the top so as to snug down to the head to some extent, is a strong feature of the Wyandottes all through. We found it strongly transmissible by the Silvers, even when crossed. It cannot be improved upon for utility in cold climates. These birds should not have white in the lobes of the ear, nor should they show that jumble of color in the main feathers, which the experts term "mossy."

While the birds have the quietest and best of dispositions as regards their owners, and are never nervous or troublesome, they are jealous and ugly at times toward companions, especially if these are of other breeds, or of weakly, delicate habit. They are affectionate, but have no chivalry.

**HENS AND EGGS**

Undoubtedly there are many readers of **AMERICAN GARDENING** who keep hens who do not take a poultry paper; possibly some take the wrong one. Gardening, fruit culture and poultry keeping dovetail together perfectly, each filling a season comparatively dull in the others.

Realizing the above facts, we have arranged with the publishers of **POULTRY MONTHLY**, to offer that journal in club with **AMERICAN GARDENING**, for the coming subscription season, both journals postpaid, one year, for the **SMALL SUM OF \$1.25.**

**POULTRY MONTHLY** is now in its nineteenth year; it has always been recognized as the leading publication in its particular field. Sound and reliable in its teachings, and not the mouthpiece of cranks, cliques, or rings. Its correspondents are practical and successful men, in the harness to-day. The publishers of **AMERICAN GARDENING** recommend **Poultry Monthly** as being one of the very best poultry papers issued, and advise all interested to accept this Great Combination Offer.

**A WONDERFUL OFFER!**

**American Gardening (Weekly), \$1.00** } **Both \$1.25**  
**Poultry Monthly, - - 1.00** } **One Year, postpaid,**

Present subscribers who are in arrears must pay up in full to become eligible to this offer.

**Address AMERICAN GARDENING, P. O. Box 1697, New York City.**

### The Spaniards Say

"By the street of By-and-by one arrives at the house of Never." While fence building is delayed damages sometimes result which would pay for fence. SUCH economy (?) does not "lead to wealth."

## DO YOU NEED WATCHING?

Or, to put it another way,

### Do You Need a Watch?

We sell them, sell them at such an exceedingly low price that you can't afford to go watchless.

Got 'em all sizes and styles.

But we'll just mention two:

An Elgin or Waltham Watch, best movement made, hunting case, accurate time-keeper, handsomely engraved, Double Case, heavily gold-plated—last for all time. Ladies' or gentleman's size.

We'll send it to your address with privilege of examination. If it's not entirely as represented, send it back—costs you nothing. If you like it, pay the agent express charges and \$6.50. That's fair. Or this—

A Hunting Case Watch—beautifully engraved case, first-class movement, any size, heavily plated (14k)—looks just like a \$40.00 gold watch—keeps as good time as any of them. Sent to your express agent with privilege of examination—same conditions as all our watches sent out—and if you like it, pay him \$5.45 and express charges.

If you take our word for it, and send money with order, a handsome chain goes with either, and express charges are paid by us, for the prices named above.

# WHOLESALE MARKET REPORT.

## New York.

The horse show created great expectations in the flower market in the way of clearing out and raising prices. This it failed to do, but, fortunately for growers, there was a slight falling away in shipments and at the same time an increase in shipping orders from out of town, together with an increased funeral and family trade. Dealers have been able to clear out without the terrible sacrifices of recent weeks. Roses have improved but slightly in value. Beauty still keeps in excess of the demand, and \$3 per dozen was the highest possible figure obtainable for fancy stock.

Carnations are in better demand and are again up to the \$1 and \$1.50 mark, with strictly fancy going at \$3 and a few specials making more.

Violets towards the close of the week improved considerably: \$2 per 100 for good Violets was the prevailing figure.

Valley is firm at from \$3 to \$4 for good grades.

Lilies are slow to move at \$6 and \$8 per 100.

Chrysanthemums have not kept pace with Violets and show but little if any improvement over last week, except for a very few.

The fruit and vegetable market continues to clean out steadily, and on the eve of Thanksgiving business is good; no shortage of any particular stock is reported neither is there any noticeable boom in values. Just normal conditions prevail and that is all.

Hothouse grapes (European) make \$1 per pound.

Tomatoes move freely with 25c. per pound top figure.

Hothouse lettuce are plentiful, No. 1 stock, six dozen to a barrel make 50c. per dozen.

Cucumbers 60@75c. per dozen, demand light.

Apples—Albemarle Pippin, Va., poor to fair, \$1.50@2.50; good to fancy, \$4@5; Winesap, Va., poor to fair, \$1.75@2.50; good to fancy, \$3.50@4; Johnson's Winter, Va., poor to fair, \$1.75@2.50; good to fancy, \$3.50@4; King, State, Va., poor to fair, \$2@2.50; good to fancy, \$3@4; Ben Davis, western, poor, to fair, \$2@2.25; good to fancy, \$2.50@3.25; Greenings, State, poor to fair, \$1.75@2; good to fancy, \$2.50@3.50; Baldwin, State, poor to fair, \$1.75@2.25; good to fancy, \$2.50@3; N. Spy, State, poor to fair, \$1.75@2.25; good to fancy, \$2.50@4.

Pears—Seckel, State, per bushel box, \$1.25@2.50; Boston, fair to fancy, per box, \$2@6; Beurré Bosc, per barrel, \$2@4; Beurré Bosc, Boston, fair to fancy, box, \$2@3.50; Kieffer, per barrel, \$2@3; Lawrence, per barrel, \$1.50@2.50; Beurré Clairgeau, per barrel, \$2@3; Beurré d'Anjou, per barrel, \$1.75@2.50.

Grapes—Delaware, per small basket, 10@14c.; Niagara, fancy to ex. fancy, small basket, 14@20c.; Catawba, fancy, per small basket, 10@12c.; Concord, per large basket, 11@13c.; white kinds, in trays, per 100 pounds, \$1@1.50; Catawba and Concord, in trays, per 100 pounds, \$1@1.25; very inferior, per 100 pounds, 50@75c.

Cranberries—Cape Cod, special varieties, fancy, large, dark, per barrel, \$7.50@8.50; Cape Cod, fancy, sound, per barrel, \$7; Jersey, sound, medium color, per barrel, \$5.75@6; Jersey, sound, medium to good color, per crate, \$1.75@1.90.

Oranges, etc.—Florida, bright, fair to choice, per box, \$3@4; Florida, russet, fair to choice, per box, \$2.75@3.50; grape fruit, bright, per box, \$5@7; mandarins, per box, \$6@7; tangerines, per box, \$7.50@12.

Pineapples—Florida, per case, \$2@4.

wax, per basket, 50c.@\$1.25; Florida,

green, per basket, 50c.@1.

Turnips—Russia, Canada, car lots, per

barrel, 50@75c.

Tomatoes—Florida, per carrier, \$1.50

@2.50.

Turkeys of good quality are clearing

out well at an average of 15c. and 16c.

per pound. There is a large quantity of

inferior stock and these are difficult to

quote. The quotations are on dry

packed.

Turkeys—Jersey and up-river, fancy,

per pound, 16c.; state and Penn., fancy,

per pound, 15c.; state and Penn., good

to prime, 12@13c.; western, fancy, per

pound, 14c.; western, good to prime, per

pound, 12@13c.; western, poor to fair,

per pound, 8@10c.

Spring chickens—Phila., fancy, per

pound, 12@14c.; spring chickens, Phila.,

fair to good, 8@11c.; Jersey, prime,

per pound, 10@11c.; state and Penn.,

good to prime, 9@10c.; western, prime,

per pound, 8½@9c.; western, fair to

good, per pound, 7@8c.; western, inferior,

5@6c.

Fowls—State and Penn., good to

prime, 8½@9c.; western, prime, 8

8½c.; western, fair to good, per pound,

7@7½c.; western, inferior, 5@6c.

Ducks—Eastern and L. I., spring, per

pound, 12c.; western, fancy, per pound,

9@10c.; western, fair to good, per

pound, 7@8c.

Geese—Eastern, spring, white, per

pound, 14@15c.; eastern, spring, dark,

per pound, 12@13c.; Maryland, prime,

per pound, 11@12c.; western, prime, 9

@10c.; western, fair to good, per pound,

7@8c.

Squabs—Choice, large, white, per

dozen, \$2.25.

## Boston.

Good hard-shelled Hubbard squash in good demand at \$25 a ton; other grades will bring about \$20; Marrow \$20, Turbans \$25, Bay State \$25.

Onions meet a good demand at \$2.25 a barrel; if stock is fancy will bring \$1 a bushel for home-grown.

Turnips, White, French stock selling \$1 @1.25 a barrel; yellow stock \$1; white flats \$1 per barrel.

String beans selling \$1@1.50 a basket; mint 40@50c. a dozen bunches; radishes, good demand, at 30@40c. a dozen bunches; spinach 25c. a bushel; parsley 50@75c.; carrots 75c.@\$1; beets 50@75c. a dozen bunches; artichokes 75c. a peck; leeks, 75c. a dozen; Brussels sprouts 10@15c. a quart.

Egg plant still continue in good demand at \$3@4 a crate; green peas \$2 a basket; if choice would bring higher figures; Boston Market celery \$1.50@1.75 a dozen; German celery same as last week, 75c. a dozen.

Oranges, 150-176 count, \$4.50@5; 126 count, \$4; grape fruit, \$7@8 per box, counting from 54-80. Cauliflowers market firm at \$1.25@1.50 per dozen heads. Cabbage market remains the same as last week, in fact, has remained about the same for a number of weeks.

Hothouse cucumbers are in good demand, if very choice, \$1@1.25 a dozen.

hothouse lettuce little weaker from last week, dropped back to 25@35c.

Mushrooms, fair demand, 50c. if good, that is per pound.

Hothouse tomatoes selling 25@30c. a pound; a good demand in consequence of Thanksgiving.

Hothouse grapes 30@50c. a pound.

Green Mountain potatoes, if choice, worth 80c. a bushel; Hebrons 75c. Sweet potatoes selling \$1.75 a barrel for Virginia stock, and \$2.25 for Jersey stock.

Apples, Greenings, \$2.50@2.75 a barrel, No. 1 stock; Baldwins, \$2.75@3 a barrel. Prices not quite so firm as last week's.

Pears, fancy Seckels out of the market; Duchesse, \$1.50@2.50; Beurré d'Anjou, \$1.50@2; Beurré Bosc, \$3@4; Beurré Clairgeau, \$2.50@3; very few on the market now.

Cranberries still continue firm, \$5@6 a barrel; \$1.75@2 a crate; some very choice would bring \$6.50@7.

Quinces are now out of the market, and we cannot give any different prices on grapes from last week.

### Philadelphia.

Both foreign and home-grown hothouse grapes are very quiet, there being very little demand for either.

Receipts of apples are increasing, while there has not been any improvement in the demand; prices in consequence have ruled a trifle lower. Kings, per barrel, choice and fancy, \$3.25@3.50; Winesaps, per barrel, choice and fancy, \$3@3.25; do. fair to good, per barrel, \$2.25@2.75; Ben Davis, per barrel, choice and fancy, \$2.75@3 do. fair to good, per barrel, \$2@2.50; Rome Beauty, per barrel, choice, \$3@3.50; do. fair to good, \$2@2.75; Greenings, per barrel, choice and fancy, \$2.75@3; do. fair to good, \$2@2.50; Baldwins and Spies, per barrel, choice and fancy, \$2.75@3; do. fair to good, \$2@2.50; mixed varieties, per barrel, choice, \$2.50@2.75; do. fair to good, \$2@2.25.

Grapes, New York: Concord, per 5-pound basket, 8@8½c; per 10-pound basket, 12@13c; N.-Y. Niagara, per 5-pound basket, 10@11c; N. Y. Catawba, per 5-pound basket, 7@8c.

Native grapes are plentiful and are selling fairly well.

Cranberries are only in moderate supply with prices firm, under a good demand. Cape Cod, fancy large varieties, per barrel, \$7.50@8; medium, per barrel, \$5.75@6.50; per crate, \$1.75@2.50. Jersey, per crate, \$1.25@1.75.

Florida oranges are selling very well at steady prices; choice, per box, \$3@3.50.

Pears—Kieffer, Jersey, per barrel, \$2.25@3.50; Seckel, per barrel, \$4@6; very few being offered.

Potatoes—There is a good demand for choice stock, which is scarce, indicating that it is being held for an advance. The market is liberally supplied with medium stock. Prices are for choice stock, per bushel 70@75c.; fair to good, 60@75c. per bushel. Jersey sweets, per basket, choice, 45@55c.; fair to good, per basket, 20@30c.

Cauliflower—Choice, per barrel, \$1.25@1.50; fair, per barrel, 50@75c.

Celery—Choice, large, per dozen, 20@35c.; fair to good, per dozen, 10@18c.

Cabbages are in large supply, and prices favor buyers. Prices, per 100 heads averaging 6 to 8 pounds, \$2.50@3; heads averaging 4 to 6 pounds, per 100, \$1.50@2; lighter heads, per 100, \$1@1.25.

Cucumbers—Florida, per crate, \$1.50@2.

Egg plants—Florida, per one-half barrel box, \$2@3.

Green peas—Per one-half barrel basket, 75c.@\$1.50.

Onions—Yellow, per barrel, \$1.25@1.60; choice, white, per bushel, 85@70c.; yellow, per bushel, 55@60c.; common, per bushel, 40@45c.

String beans—Per one-half barrel basket, 20@35c.; wax, per one-half barrel basket, 20@40c.; Charleston, green, per bushel box, 15@25c.

Mushrooms are now very plentiful and prices have fallen to 35@40c. per pound.

# OUR CLUB LIST

## LET US FILL YOUR ORDERS FOR 1898.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

Agricultural, etc.		A.	B.	General—Con.		A.	B.
American Agriculturist.....		\$1 00	\$1 85	Donahoe's Magazine.....		\$2 00	\$2 00

We Call on every reader to secure at least one new subscription now to **AMERICAN GARDENING** for 1898, so they will not miss any of the following offers and inducements:

## Prospectus for 1898

### All the Good Things Continued

Which have made **AMERICAN GARDENING** the standard publication of the Horticultural world, and given it more bona fide subscribers than all other Horticultural papers combined.

### Cash Prizes Offered Every Week

For Photographs of Well-grown Specimens (flower, fruit, vegetable or plant), with description as to how the result depicted was attained—from start to finish.

### Cash Prizes Offered Every Week

For Best Answers to Question Box. This department is absolutely free, and there is no necessity for any reader to remain in ignorance on any subject which may puzzle him.

### Colored Art Supplement Every Month

Free to every subscriber.—Beauties all. Every one values a good picture. Ours will be more than good.

### Cash Prize for Best Essay

On a Subject of General Interest. One Prize every month.—This feature we expect to prove a drawing card.

### Literary Supplement Monthly

Special Feature for Advanced Readers, containing articles of more permanent and scientific interest.

### New Writers on New Subjects

Which we know our readers will appreciate.

And with all this

{ Array of  
Attractions

## We Give Premiums

To those who obtain us a new subscription as well as to the new subscriber. See advertising columns.

Don't fritter away your time and money on worthless reading. Subscribe to a practical publication, admitted by all the standard authority of the age and country. Take our advice: Talk American Gardening to your friends, get their subscriptions, and they will bless you evermore.

### 1840 OLD COLONY NURSERIES. 1897

**Hardy Shrubs, Trees, Vines, Evergreens and Perennials.**

A large and fine stock of well-rooted plants, grown in a sandy loam. Good plants, best sizes for planting; very cheap. Priced Catalogue free on application.

**T. R. WATSON, Plymouth, Mass.**

Mention American Gardening when you write

### Oak-tanned leather Harness

Send your address with a-cent stamp for Illustrated Catalogue, all kinds of Single and Double Custom-Made Harness, and direct to the consumer at wholesale prices. **WE CAN SAVE YOU MONEY.**

**KING HARNESS CO., No. 3 Church St., Orange, N.Y.**

Mention American Gardening when you write.

### Peach Trees for everybody.

Wholesale and retail **K.B. JOHNSON, Box 21 Steeple, Del.**

Mention American Gardening when you write.

**We PAY FREIGHT** BOX and Pack free. **PAPER** line all boxes. **REPLACE** free. Give **BUYER'S** choice; low **WHOLESALE** prices orders large or small; 10 trees at 100 rate, 300 at 1000 rate. Guarantee **SAFE ARRIVAL**, trees **TRUE** to name. **FREE** from **SAN JOSE** scale, and of **BEST** quality. Guarantee **SATISFACTION**.—WRITE for lists, photos and **FULL** particulars of foregoing **Stark 12 CHALLENGE** Points. **STARK BROS., Louisiana, Mo., Stark, Mo., Rockport, Ill., Danville, N.Y.**

## Peaches and Nectarines Under Glass.\*

Probably some will say "what's the use of growing peaches and nectarines under glass, when we have at command such fine specimens as the California produce?" and, of course, we must admit the California peaches are nice to look at, and that's about all that can be said in their favor. No doubt if we were in California and could gather the peaches ripe, that they would be pretty good in flavor. In order to ship peaches from California to New York, they must be gathered before ripe, which spoils the flavor. All stone fruit should be ripe before it is gathered.

Hothouse peaches and nectarines when properly handled have no equals in all the line of fruits, and it is to be hoped that fruit growing under glass is in its infancy in the United States. Anyone who realises the value of fruit, cannot but wonder when visiting some of the principal private establishments, that there is no fruit of any kind grown under glass. In my estimation a private establishment with any pretensions to glass, if in the country, is not complete with the fruit house (or houses) left out.

I presume that in presenting a paper on a given subject it is customary to give something of its history, etc. I, however, will pass that over. It matters little to me whether the peach originated in Persia or in Egypt; but let us return thanks to our forefathers for taking in hand so valuable a fruit, when we look over the list of peaches and nectarines at our command and consider the improvements that have been made. It's difficult to draw the line in regard to varieties for our limited space.

The title of my subject is peaches and nectarines, but I am inclined to reverse matters, and class the nectarine before the peach. We are greatly indebted to Rivers, of Sawbridgeworth, England, for the wonderful improvement he has worked on both fruits; the name of Rivers is known to fruit men all over the world, and I think I am safe in stating that he's done more than any other one man in bringing out new and meritorious varieties of fruits, and those that he's sent out will be as monuments to his name for generations to come.

But we must not lose sight of the American varieties of peaches especially, Hale's Early peach, for instance, is one of the very best for early forcing both here and in Europe; Crawford's Early, Crawford's Late, Foster, Mountain Rose, are all fine varieties of American origin and should be in every collection.

Later on, to the best of my ability, I will speak of the varieties with which I have had experience, and know to be good, starting with the earliest and grading down to the late. And this matter of succession is surely an important one in fruit growing under glass; to have your trees so arranged that they give a continuous supply from the time you start gathering until the season is ended is a necessity. In our own case, with three peach houses at our own disposal, we have no difficulty in extending the season from the middle of May to the end of September, giving a continuous supply all the way through.

The nectarine is not so widely known as its merits deserve. The fruit is not as large as the peach, but we can carry more on the trees, so there is not much lost in that respect after all. Speaking from experience, there's something in the flavor of a nectarine that one never seems to get tired of; whereas, of peaches one does tire.

I would not advocate the growing of nectarines exclusively; I believe in a mixture.

The following is a list of nectarines which are all A1, and will give a long season of fruit, commencing with the earliest and on in succession:

Early Rivers, a valuable early nectarine not widely known in this country. A few words of introduction will not be amiss. It's one of Rivers' latest productions, and a variety of which he may

well be proud; it supersedes all others of my acquaintance as an early nectarine. Fruit large, trees of vigorous habit.

Then comes Lord Napier, Improved Downton, Elruge, Rivers' Orange, (an Improved Pitmaston Orange) Pineapple, Chaucer, Humboldt, Stanwick, and lastly Victoria, will wind up the season.

There may be other varieties just as good as these named, although I am not acquainted with them; I am simply giving those with which I have had experience, and whoever plants the above list will have a long season of nectarines and varieties of the best quality.

As to peaches with such a long list of varieties at hand, it would be a difficult matter for the beginner at fruits under glass to know where to start the selection, and once started where to leave off! The following is a list of tested varieties given in order of succession: Alexander, Hale's Early, Rivers' Early, Early York, Mountain Rose, Crimson Gálante, Belle-gard, Foster, Crawford's Early, Crawford's Late, Prince of Wales, Princess of Wales, Lord Palmerston and Lady Palmerston. The last-named should certainly be in every collection of late peaches under glass; it is fully two weeks later than Crawford's Late, and for flavor cannot be surpassed. It is between a nectarine and a peach; in fact this magnificent variety was raised from a stone of the Pineapple nectarine.

Now that we have our varieties selected and graded, the next important point for attention is the border. Peaches cannot be grown without perfect drainage either inside or out. It does not matter how careful we are with the general treatment, with imperfect borders the results will be unsatisfactory. I would suggest in building fruit houses that they be erected where the water has a good chance to get away, and it is less expensive not having to provide drains to carry off the water.

Our fruit houses have no drains to carry off the water. The bottom of the border is filled in with about one and a half feet broken stone, followed by two and a half to three feet of good mellow soil. Peach trees don't like sandy soil, neither do they like one too stiff, just a happy medium is demanded in making up a border for peaches and nectarines. It pays to thoroughly firm the soil.

Another thing should not be lost sight of; by no means make the border too rich, or the trees will have a tendency to make such rank wood that it will be almost impossible to keep them within bounds. It is better by far to add food to the trees, as they need it; and it is easier to add than to take away. In taking visitors through the houses, I have often been asked questions that I could not answer, the one most generally asked is, how long will the trees last? That is a question I cannot answer. During this past season I have gathered some of the finest fruits from the oldest trees. The variety was Crawford's Late and individual fruits measured one foot around and weighed fifteen ounces. My opinion is that a fruit tree is just as good at ten years old as at five, when properly handled. In the treatment of the trees from the time they are started until the fruit is gathered, probably any two growers will vary a little in detail, but one thing is certain, success for next year depends largely in finishing up the wood this fall. If the wood is not thoroughly ripened in the fall, it is impossible to get high-class fruit.

I have been fortunate in having been under some first-class fruit growers, both in England and Scotland, where I was always taught to tie in the young wood on peaches and nectarines. It must be admitted the trees look neat handled that way, but I have found through experience that I can get better wood, more thoroughly ripened, by not tying in the young wood at all during the summer. Anyone not having tried this plan will probably think it an untidy method, but it is the crop we are after, and during the winter months the old wood can be cut away and the trees can be tied into fairly good shape. Or it would be better to cut away the useless wood as soon as the crop comes off the trees, so

as to give next year's wood a better show to ripen up.

One is apt to neglect the trees in fall after the crop is off, but it is a mistake to do so, and an expensive one. Peaches and nectarines need attention until the foliage comes off, and should not be allowed to get very dry. After the crop is off they don't need the amount of water they do when they are carrying their fruit, but a tree should never be allowed to wilt for want of water. By giving the trees good attention in fall, thoroughly ripening the wood, there should not be much trouble with the trees dropping their fruit next season.

In getting a house ready to start, I know of nothing better than to give the trees a good wash with gishurst compound or whale-oil soap, except the fruiting wood; that I never wash. After the trees are tied into shape clear all the loose soil off the border, give a top dressing of cow manure, a little bone meal and wood ashes, and fresh soil forked in. I then consider the house in shape to start.

I have come to the conclusion the less we use of chemical manures the better, although the man who has the fertilizer tells me I can't have good results unless I use some of his best grade. On that subject, however, I have my own opinion: I say again cow manure is good enough for me.

(To be concluded.)

## The Fruit Garden.

### Grafts.

Where any are wanted they should be cut, labeled, and stored away out of the reach of frost. A good way is to pack them in a box and cover with sand.

### As to Labeling.

Speaking of labeling reminds me that this detail can be carried farther by seeing that all the trees you are sure of are labeled correctly. As to those you are not certain about, why, find out the names of them, which is not a hard matter where the "want to" is good. Another thing is, it will make the trees more interesting to you, to the workman, and to your visitors.

Of course, a label that can be seen 20 feet away is not wanted nor called for, but zinc labels, such as recommended in AMERICAN GARDENING for January 9, page 21, are good, and the narrow end can be wound, one and a half turns about a small twig, or a nail in a certain part of the tree. I have used pieces of zinc cut 1½x1 inch and fastened to the trunk by one wire nail.

Of course there are some men who can remember the names of everything—or make them to order—and other men who prefer to keep the names privately in a book, and leave a number on the tree for the hired men. Neither of these methods is very encouraging for the lad who wants to learn, nor are they very flattering to the one in charge. He's a poor teacher who cannot keep ahead of the pupils!

### Caterpillars' Eggs.

When pruning keep a sharp eye for eggs, a likely place for them is under an ordinary looking dead leaf, but that leaf does not get blown away, and serves to keep the bunch of eggs dry.

### Covering of Strawberries.

Don't forget to provide some covering for the plants; it is to be used some dry day when the ground is frozen hard and dry, so that it is fit for working on.

J. HOLLOWAY.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

\*Paper by W. Turner before the Dutchess Co. Horticultural Society, Dec. 1, 1897.

## Draining Land With Trees and Shrubs.

I recently found it necessary to select a location for the cesspool of a new house, and in the light of past experience I fixed upon a place a rod and a half from an elm of a century's growth, and within a few feet of a proposed line of hedge. The location would also be where a bunch of arbutus, or evergreens, could be grouped to give a good effect to the lawn when laid out. I placed the cesspool in this situation because I had learned by experience that trees and shrubs drink up enormous quantities of liquids from the ground, and that their roots delight to feed upon just such impurities as will soak out into the surrounding ground from cesspools and sink drains. No one would believe that quantities of water the roots of a single tree even, will take up from the ground, unless he has had a practical demonstration before his eyes. I well remember what first brought the matter to my attention. A country home, in whose owners I was interested, had an open sink drain, that in the summer season became very much of a nuisance. The ground was filled with and covered with an ill-smelling flood of soapy water. I procured a supply of young evergreens and set a hedge alongside the drain. The trees grew rapidly, and the ground that before had been like a sponge filled with water became hard and firm and remained so. I do not recommend open sink drains, though these are much better than closed drains that are not properly trapped, but where such a drain exists, and is likely to exist, or where a cesspool is to be located, I know the presence of trees and shrubs is desirable. Hedges may be made doubly serviceable in this connection oftentimes, serving the purpose just described, and that of wind-breaks and of objects of beauty for a well-kept hedge about one's house is exceedingly attractive, and such a hedge can be procured right at home, many of our native shrubs and trees making the very best of hedges.

WEBB DONNELL, "Quillerott," Maine.

## Autumn vs. Spring Digging.

The subject of digging is a more important matter than appears at first sight, because modern investigation has thrown a fresh light upon much connected with the soil and the conservation of its properties.

For a large number of cultivated plants, the supply of nitrogen is of the utmost importance, and this is obtained chiefly from the nitric acid of soluble nitrates derived either from applied manures or from decomposing substances already in the soil. During the summer months, and with a due amount of moisture present, the production of these sources of nitrogen proceeds continuously and at a much greater proportionate rate of increase than in the winter. The constant stirring of the surface by means of hoes or other instruments in the warm months considerably accelerates the formation of the compounds named, by the admission of air.

Thus, if a piece of ground is unoccupied by a crop during the summer, and it is attended to in the surface-stirring mentioned, there is by the time autumn arrives a material increase in fertility. Even if it be occupied by a crop, unless it be a very exhausting one, or close planting is adopted, there may be some accumulation if the land has been previously well manured.

In the autumn and winter, however, the condition of affairs is reversed; so long as the soil continues warm, and not over-saturated with water, the nitric acid formations will continue, though in lessening degree, until in the winter very little indeed is produced. Then, too, we have the greatest waste going on, particularly in a wet season; the compounds formed during the summer are rapidly washed away if the soil is not occupied with a crop, and we have to

make up this loss by the addition of costly manure, or the land becomes impoverished.

Regarded, therefore, solely from the point of view of naturally increasing the fertility of the soil, we know that in digging ground in spring or summer we are certain to gain, while the same operation in autumn or winter will as certainly lead to some loss of the constituents, and perhaps in a great degree if the winter prove to be wet. In both cases this is assuming the ground to be unoccupied—but in few gardens can ground be allowed to lie fallow for several months; therefore it only occurs when a crop is removed in the autumn too late to put anything else on it. Then if it have to wait for a crop until spring it would be economical to defer the digging until spring. An ordinary rich garden soil that has been in cultivation for many years contains such a superabundance of humus that the winter loss is not a very serious matter, as it is soon made up by decomposition.

The mechanical advantage of autumn digging when dealing with rough and heavy ground cannot be questioned, as whatever loss may be sustained by drainage is more than compensated by improved workable condition of the soil, while the more ready escape of water increases the warmth of the soil. Heavy

FIG. 226.—A DAINTY FLOWER BOX.

ground that has not been under good cultivation, dug roughly in autumn, and exposed to winter frosts, will be in a better state for planting in the spring than three times the labor could effect at that time. The rough exposure of ground to the frosts also has a tendency in a severe winter to greatly reduce the insect-pests which find shelter in the soil.

The storage of humus in soil is an important matter beyond all doubt, but it only gradually restores to land what the crops have absorbed. Sir John Lawes says: "Humus (in which term I include all vegetable matter in a state of decay) is very insoluble in water; but sooner or later it assumes the form of nitric acid, which combines with lime or other alkaline substances in the soil, and then becomes very soluble in water. These compounds rise and fall with the water in the soil, coming to the surface in dry weather, and passing into the drain, in the absence of growing vegetation in wet weather. When a crop is in the full vigor of growth the soil-water may contain more or less nitrate. Being soluble in water and entering into no combination with the soil, nitrate cannot accumulate. Each year fresh nitrates are formed from the decomposition of the humus, the fertility of the land depending largely upon the amount of nitric acid liberated every year. What we call condition is so much added to the stock

of organic matter which in the course of a few years is decomposed, yielding nitric acid and mineral substances."

Autumn digging should always, where possible, be followed immediately by a crop of some kind. Without that there is a certain, though variable, loss of nitrogen-yielding and other compounds during winter. In gardens and in improving heavy soils, this loss is counterbalanced by other advantages, but in large areas of land, such as fruit plantations, it is more economical either to crop the land or to leave the digging until spring.—Gardeners' Chronicle.

## A Dainty Package of Cut Flowers.

One frequently desires to make an especially dainty offering of choice blossoms, to some sick friend, perhaps, and when this is the case, the receptacle for the flowers becomes an object of concern. Something a bit out of the common is shown in the accompanying illustration. This little box is made of rough, heavy paper, cut after the pattern that is given, and folded on the dotted lines. The paper on which water-color drawings are made is excellent for this purpose. When the flowers have been arranged within, secure the cover by two pieces of narrow white, or daintily colored ribbon, tied in bows at the top. A daintier offering could scarcely be conceived.

WEBB DONNELL.

## Tomatoes Under Glass.

In securing an abundant supply of tomatoes during the winter months, much depends upon the start the plants have made, the aim being to set a heavy crop of fruit before the short and perhaps sunless days. They should be trained not less than two feet apart, so as to give the bunches of flowers plenty of light and air, without which they become weakly and fail to set. Crowding must in all cases be avoided.

The single stem system of training seems to be the best, which briefly described, consists in rubbing out all side shoots as they form, the main stem being encouraged to grow and form strong clusters of fruit. Allowing side shoots to grow only weakens the plant as well as the bloom. Their early removal favors a large crop.

The first clusters of fruit ought to be freely thinned out, all large ugly flowers removed early, or otherwise a good succession of fruit will seldom result. Artificial pollination of the flowers is also necessary throughout the winter; this can best be accomplished by the aid of a camel's-hair brush or by shaking the plants gently toward midday or when the pollen is the driest. On no account should this be neglected, failure to set crop being the principal or most frequent cause of failure.

Give plenty of air; on all moderate days the temperature should be kept as near as 65 degrees at night with 10 to 15 degrees higher by day in sunlight. The tomato, in fact, is a subject that will not endure much of the nature of forcing, and if practised at all it must be done in a very gentle and judicious manner or the result will be a bad attack of fungus.

Watering has to be done in a careful manner in the early growth of the plant. It will do no harm to keep the atmosphere moist only on sunny days, that is merely to wet down the walks. At the time of fruit setting, of course, the atmosphere has to be dry around noon or the brighter part of the day, in order to pollinate the flowers. When watering the plants care must be taken. It is always best to wait till they are dry, then give a good soaking. Never water in a careless manner, which usually leaves surface wet and the under soil dry.

As to varieties, there are the Lorillard, Volunteer, Beauty, Golden Queen, and Dwarf Champion; the Lorillard is the standard. JOHN J. FARRELL, Conn.

### The Stinking Toadstool.

I advise G. L., N. J., under heading "The Stinking Toadstool," page 798, to freely use flowers of sulphur which is certain death to all forms of fungi.—JESSE ROBBINS.

### Rosa Rugosa as a Hedge.

The plants referred to in a Newport garden (page 795) were planted by me in 1889, and as I recall the matter, were about 2½ feet apart, which answers well for a low wind-break.

A variety of *rugosa* Comte d'Epresmesnil has semi-double flowers, very fragrant, and bears many flowers throughout the summer, but is not so free in producing hips (seed-pods).—J. HOLLOWAY.

Those in the group referred to in your issue of August 14 last, are planted from 2 feet to 2 feet 6 inches apart in the rows, and the same distance between the rows, there being eight rows altogether to form the screen.—ALEX MACLELLAN, Newport.

### How to Use Cow Manure.

Stack it by spreading a layer of it on sods or soil. Cover it with a layer of soil and so proceed, cutting down and mixing both together later. The old cow manure pile is a favorite place for developing the larvæ of May bugs, which in the white grub stage sometimes do considerable damage to strawberry plants for feeding on the roots.—J. H.

This material, unmixed with litter of any kind, is very inconvenient to handle and difficult to quickly prepare for use. There is a variety of opinions as to the cause of the difficulties which are experienced. If the material is mixed with about 10 per cent. of quick-lime and placed in small piles sprinkled over with gypsum, decomposition should be fairly rapid with but little loss of nitrogen; the operation should be carried out under shelter.

I can see no reason why well-rotted cow manure should not be used for strawberry growing provided there is enough potash in the soil to balance up the nitrogen from the manure.—J. F.

### Night Soil.

Storer's Agriculture, Vol. II., pp. 28-34 and 69-76, covers the night soil question fully.—J. F.

### Leaves for Manure.

Ten per cent. of lime mixed with the moist leaves will hasten decomposition if the pile is kept moist and forked over occasionally.—J. F.

### Planting Raspberries in Fall or Spring.

The beginning of October and the end of March are times of about equal choice for planting red raspberries, but the busy man finds he has more time in the fall, and generally does the work then. Blackcaps should be always planted in spring.—J. H.

### Vines for Piazza.

The following is a select list of vines to cover piazza posts, as asked for on page 795: *Actinidia polygama*, *Akebia quinata*, *Aristolochia siphon*, *Clematis paniculata*, *Lonicera Halleana*, *L. reticulata aurea*, *Wistaria sinensis*, and variety *alba*, *Periploca græca*. All the foregoing are hardy.—W. T.

### Greenhouse Heating.

The figures given by Wm. Hanson, page 795, merely show the length and width of the house, but give no idea of its form or of the amount of glass exposed, and it will be impossible for any one to give an intelligent answer to the questions asked. However, to aid Mr. Hanson in ascertaining for himself the amount of radiating pipe he will require for his house, I will say that I should use one linear foot of 1¼-inch pipe for every square foot of glass in the house plus one-fifth of the exposed wall surface, provided

he lives where the temperature falls to 10 below zero, and if he wishes to propagate stove plants. I would have one as an overhead flow and the returns could be about one-half under the propagating bench and the others where they would best maintain the temperature of the house. The proposed plan of inserting the heating coil into a stove would answer if the work is properly done. While one-inch pipe can be used and enlarged as proposed, I should prefer to put in a 1¼-inch coil.

While a coil one-fifteenth or even one-twentieth as long as the radiating pipe would answer, I should use about one-twelfth as much free surface as radiating surface.—L. R. TAFT.

### Specimen Tree for Lawn.

Some time back an inquirer asked for advice as to what tree would be good as a lawn specimen, something attractive. I would suggest a Norway Maple, it is a handsome tree, not particular as to soil, and in the fall takes on a glorious yellow color lighting up the garden wonderfully, and in refreshing contrast to the red-brown tones around.—STEPHEN HOYT, Conn.

### Wintering Cannas and Caladiums.

Cannas or Caladiums if kept cold and wet during the winter rest will almost of a certainty rot. They must be stored in a dry spot and so kept in an intermediate temperature and condition that they will keep plump and fresh without being excited into growth until needed.

### Why Cinerarias Drop Foliage.

There is too great a rise in the temperature in the daytime to suit the plants mentioned on page 811. Through such extremes all the moisture is driven out and from around the plants, hence the loss of leaves.

The best Cinerarias we have ever had have been grown in pits kept at from 40 to 45 degrees and sometimes the temperature fell dangerously near to freezing; even then the plants seemed to like it. The chief danger at such a low temperature was damping, but judicious ventilation in the daytime avoided trouble.

One thing certain about this plant is, if you want to get great, clear green foliage with lots of spread and afterwards large bold heads of bloom, the plants must be grown on a cool moist bottom at a low temperature, avoiding frost of course. For while the plant likes to be grown cool, it gets nipped by frost more easily than almost any plant.

Plants grown in a warm temperature develop small leaves and draw up spindly with flowers correspondingly small, and worse still aphids breeds the faster.—ED. A. G.

### Flowering Shrubs for Cutting.

With the long list of flowering shrubs at command, probably no two people would select the same. They are all worthy of a place around our homes, and with a good selection, there is flower from May, the first of May to September. A selection is: *Cydonia japonica* and varieties, *Deutzia crenata flora plena*, *D. Pride of Rochester*, *D. gracilis*, *D. Waterlily*, *Wiegela* in variety, *Eleagnus longipes*, *Exochorda grandiflora*, *Forsythia Fortunei*, *F. suspensa*, *F. viridis-sima*, *Halesia tetraptera*, *Hydrangea paniculata grandiflora*, *Lonicera tartarica*, *Philadelphus coronarius* and varieties, *Rhodotypos Kerrioides*. The *Spiræas* are too numerous to mention, the following are a few of the good things: *Spiræa prunifolia*, *S. Reevesii*, *S. Thunbergii*, *S. Van Houttei*, *S. crataegifolia*, *S. callosa*, *S. callosa alba* and *superba*. *Lilacs* in variety and *Viburnums*.

The above is a fairly good list of flowering shrubs, although some of the berried plants and foliage plants would help to brighten up the planting; such are *Berberis Thunbergii*, *Prunus pissardii*, *Symphoricarpos*, etc.—WM. TURNER.

The following list shows also the date of flowering at Newport, R. I.:

April 30, *Forsythia suspensa*, *F. viridis-sima*, and *F. Fortunei*. May 8, *Spiræa Thunbergii*. May 20, *Spiræa Van Houttei*, *Cydonia japonica*, and *Cornus florida*. May 28, *Deutzia gracilis*, *Staphylea colchica*, *Azalea americana*, *Lonicera tartarica*. June 1, *Halesia tetraptera*, *Rhodotypos Kerrioides*. June 5, *Spiræa crataegifolia*, *Azalea mollis*, *Berberis vulgaris*. June 15, *Wiegela rosea*. June 22, *Chionanthus virginica*. June 25, *Wiegela virginica* *Lavellii*. June 25, *Rosa rugosa*. June 30, *Deutzia crenata*, *Rubus odoratus*. July 8, *Rose Madame Plantier*. July 6, *Rhus cotinus*. July 10, *Rhus glabra lacinata*, *Deutzia crenata* fl. pl. July 15, *Spiræa Bumalda*. July 24, *Hydrangea nivea*. August 28, *Hydrangea paniculata grandiflora*.

All are hardy here, and in the latitude of New York would be in bloom at least one week earlier than the dates given.—ALEXANDER MACLELLAN.

### Indoor Decorations.

At the approach of the Christmas season there is a natural interest in suitable decorations to duly honor the ancient festival. To those who have a large quantity of evergreen shrubbery at hand the problem of gathering sufficient material is not one of any difficulty, but unfortunately not all of us have such possessions. The owner of a small lot of shrubs does not care to cut them for indoor ornamentation, and most properly so!

It is an old truism that where a demand exists some one will arise to supply it, and in connection with the desire to refresh their dwellings with draperies of greenery, our readers will no doubt be glad to know that the richness of the Southern evergreen growth is placed at the disposal of all for a very moderate charge.

Our illustration of a mantel decoration shown in fig. 825 represents what may be done in any home for the small expenditure of \$1.50, including express charge. That surely is cheap enough! These boxes of decorative greenery are put up by Caldwell the Woodsman Co., Evergreen, Ala. Other lots can be had for more elaborate and larger decorations.

For decorating an interior we would urge a careful study of our illustration, not that it should be slavishly copied, but to inculcate a vital point if the best effect be desired. In all such work as is here suggested, it is always advisable to avoid formality. Thus to refer to our figure, if the Palm Crown had been placed in the center and the Smilax and Holly evenly distributed around by a geometrical arrangement, the effect would not have been so satisfying as it now is. Again, seeing there is a doorway on the right of the fireplace, the Palm could not be used to such advantage on the left side. Why? Because the continuous drapery of Smilax on the left acts as a balance to the dark doorway and actually brings that into the picture scheme while at the same time the leaves of the Palm which reach over it act as a relief and are shown to advantage against the dark background.

What is technically termed "composition" in a picture is as great a factor as the material used. Expressed simply, without elaborating, it may be said that the figure of a pyramid should always be the basis of work, but that the apex should never be directly over the center of a horizontal base line. The angles of this triangle should be the three heavy or three light points as the occasion demands.

In our picture the light points are the mirror, the jardiniere, and the wall space to the low left while the dark centers are the base of the Smilax and Holly on the left, the bottom of the door and the conspicuous angle of the lintel which if not thus drawn into the scheme of decoration would have been an eyesore and a source of irritation to the artistic mind. L. E.

FIG. 227.—CHRISTMAS MANTEL DECORATION. (See page 824.)

## The Vegetable Garden.

### Celery.

This has proved to be favorable fall weather for celery left out-of-doors—it has frequently been noted that this vegetable should always be left in the ground as late in the fall as possible. Of course, judgment must be used in this matter, everything depending upon the weather of the locality, and other influences.

Celery stored away must be freely ventilated, and that outside in pits or left earthed up where grown, must now be provided with some suitable material for covering at the approach of cold

weather, although a few degrees of frost will not hurt it in the least, too much will accelerate its early decay.

### Brussel Sprouts Are Now in Season.

In picking the sprouts, commence at one end of the patch and as you go, pick clean all that are fit for use, so that when hard weather comes, a few good rows will remain unpicked, and by covering these with some light litter, salt hay, or leaves, will keep a long time and can easily be gathered on warm days.

### Treatment of Vacant Ground.

Plow or dig all the vacant ground,

leaving it as rough as possible, so that the winter frost will pulverize and sweeten it.

### Lettuce in Cold Frames.

These should receive constant attention. If the weather is fine and the sun shining in the morning, ventilate a little at first, adding as the day warms up, but close the sash early in the afternoon, before 3 P. M. When it is necessary to water, do it early in the morning, so that the leaves will dry up before evening. Water should be sparingly used in cold weather; it is better to keep on the dry side.

W. M. EDWARDS, Conn.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 14, 1894.

PUBLISHED BY

A. T. DELAMARE PUBLISHING CO. LTD.

ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.

Telephone, 2154 Cortlandt. P. O. Box 1697.

REGISTERED CABLE ADDRESS  
Commercial Cable) Florex, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to creditsame.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 3 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

**The Apple.** THE export trade in apples from New York Export Trade. begins to assume considerable proportions early in November, and the shipments to that city—the greatest distributing center for the trade—continue to the middle of winter.

Liverpool is the greatest distributing center for our apples abroad, and it stands next to New York in the number of apples received and sold. London, Glasgow, and Hull are also large consumers of American apples; but at Liverpool most of the auction rooms receive and dispose of the export crop. As many as one hundred thousand barrels have been sold in one week at remunerative prices in Liverpool, and every week from now on the sales of American apples will form a conspicuous feature of the auction rooms of that city.

The auction system has materially improved the apple trade in England, says the N. Y. Evening Post, and it has helped to reduce the cost of placing the fruit on the British market. The ocean freight on a barrel of apples varies from forty to sixty-five cents, but the charge in Liverpool for dockage, town dues, insurance, advertising, sampling, and the labor of handling amount only to about 7d. (14c.). Add to this 5 per cent. commission on sales, and you have the cost of delivering and selling apples in England.

The picture of the auction sales is well

drawn by our contemporary. "The auction rooms are well-arranged places, and on the days of advertised sales buyers appear in large numbers. There are regular sales on Mondays, Wednesdays, and Fridays. The apples are brought direct from the steamer to the auction place, and are catalogued according to the shipping marks and variety. Some of the shippers are so well known that their goods are sold upon their reputation without being examined; there is always a demand for such goods. All of the other brands are sampled in this way: In the center of the auction room, where all of the buyers can see what is going on, two barrels out of every twenty are opened, and the contents of one barrel emptied into baskets. Each buyer has to take at least twenty barrels; but if any in the lot he has purchased are 'slack,' they are replaced by others. A 'slack' barrel is one which rattles when roughly shaken. These 'slack' barrels are sold separately, and where a regular barrel will bring 16s. (\$4), the 'slack' barrels from the same lot will be knocked down to 2s. to 4s. (50c. to \$1)."

This last point is one of much interest to our fruit growers and has operated very powerfully to make shippers pack their apples with great care.

Each auctioneer who has apples to dispose of has forty minutes in which to sell his fruit, and if not all sold he must then stand aside until all of the others have had their turn and it comes around to him again. The auctions frequently go on until midnight on days when heavy consignments arrive by steamer. A single auctioneer has sold as many as 15,000 barrels of apples in one day.

Speaking of varieties the article stated the British buyer has very decided preferences for certain varieties of apples. Baldwins have in the past been great favorites on account of their high color and attractive appearance; but the Ben Davis apple has replaced the Baldwin to a large degree lately. More of the Ben Davis variety are shipped abroad than any other, and more orchards are being planted with these than with Baldwins and Greenings combined. King, Snow, Gravenstein, Pound Sweets, and Greenings and York Imperial are also good sellers and Newtowns always sell well if true and of high grade.

Our export apples are now invading the markets of Germany. Germany has for many years imported her apples largely from the Austrian Tyrol; but the superiority of the American apples has gained an ascendancy over these in the large cities. The Alpine-raised apples are handsome fruit—prettier, in fact, than the average American apples—but they lack flavor, juiciness, and tenderness. The agrarian press of Germany has been ready to find fault with all imported American products, and it has directed some sharp criticisms against certain defects in the American apples, but at the same time it has strongly advised all German farmers to obtain grafts of American apple-trees and plant them extensively. Heretofore the worst of our apples have been shipped to Germany, the choicest going direct to Liverpool; but the excessive crop of last year altered the conditions. New markets had to be found and with improved packing and selection the trade opens more auspiciously this year than ever before.

## A Challenge Taken Up.

Concerning Mr. Jerolaman's recent challenge we have received the following letters:

To the Editor of American Gardening.

Mr. H. Jerolaman on page 795 says, it seems, in a letter to you: "I have had eleven men for the past two days setting out plants of the Henry and Mary in a new bed for my own use, in order to show all growers what may be done in strawberry culture by setting out plants the last of October. Will wager \$1,000 with any one that it will by June next outyield any of its size (in the United States), that was set out this spring." I should think that this offer ought not to go begging for takers. If it had not been the poorest season the past season to grow plants to get them in good fruiting condition for the next fruiting season that I have ever known, and if I had not made it a life rule never to gamble, I should be in it sure.

As it is, I have got one good acre of ground that I am going to set in the spring, which I intend to make do its best. I will put this acre against one that Mr. Jerolaman may set the following October to fruit the next spring. Each shall keep a detailed account of method of culture and all expenses. These records to be made under oath, and submitted to a delegate sent by the AMERICAN GARDENING to either fruit patch at the time of first pickings. He is also to make his report under oath; all for publication in AMERICAN GARDENING, for the benefit of its readers. There is to be no money consideration except what either one gets from the direct results of such a contest.

It is fully a month later here in the fruiting season than in New Jersey.—E. W. WOOSTER, Hancock Pt., Me.

To the Editor of American Gardening.

I notice in your issue of November 20 that Mr. Henry Jerolaman offers to wager \$1,000 with any one in the United States that his bed of strawberry plants, set out the last of October, 1897, will outyield any bed of its size in the United States, that was set out last spring.

Now, Mr. Editor, while I am opposed to gambling in any form, I will accept that wager, as I do not consider it as being a bet, merely a gift from Mr. Jerolaman. This offer is good on from one to ten acres as he may select.—D. McNALLIE SARCOXIE, Mo.

"The Laborer is worthy of his Hire: so also is the Publisher."—Addressed to subscribers in arrears.

## Book Premiums.

Our friends may have forgotten that our very best premiums consist of Books. This is the time of year when everybody has leisure to read, so now is the time to work up orders. Note advertisement in this issue.

If we were to judge from appearance of this week's Question Box, a fair conclusion would be that there were only six readers who wanted others to help them. Of course this is all wrong; 'tis merely the late holiday and thoughts of future festivities have disorganized the garden side of one's nature. That's all very well, but just turn about now and immediately on reading this send in, say, one question.

## THE QUESTION BOX

*He that questioneth much shall learn much.*—BACON.

Readers are invited to forward particulars of any difficulty or perplexity that they have encountered. If the question be one of general interest it will be inserted in this column, so that other readers who may have information to impart can assist their brethren by recounting their own experiences. Questions of a purely individual interest will be replied to by the Editor under the head of "Short Answers."

Questions submitted in this department will receive the full attention of the staff of AMERICAN GARDENING and when desirable will be answered editorially.

All communications for insertion should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR of AMERICAN GARDENING, P. O. Box 1697, New York City. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query or answer are sent, each should be on a separate piece of paper.

Answers should always bear the title of the query replied to and the page on which it appeared, and our readers will greatly oblige us by advising, as far as their knowledge and observations permit, the correspondents who seek assistance. Conditions, soils, and means vary so infinitely that several answers to the same question may often be very useful, and those who reply would do well to mention the localities in which the experience was gained.

**Important to Querists.**—Correspondents must look through the whole of the paper for replies to their queries. Answers cannot always be given the week after the queries are received, but there is as little delay as possible in dealing with them.

**Cash Prizes** will be given for the best set of answers each week. Payment to be made monthly.

### Blackberries in the Orchard.

In one of the horticultural papers I recently saw the dictum that one must never set blackberries between the rows, in a young orchard. As that is just what I contemplated doing, I have been much interested to know why? If it is permissible to plant hoed crops, strawberries and other small fruits, why not blackberries? Will you kindly enlighten a "tenderfoot"?—L. R. D., Brooklyn, N. Y.

### Pears for Wisconsin.

What varieties of pears would do well and bear fruit in our Wisconsin climate?—FRED. JONAS.

### Algae in Lily Pond.

My beautiful lakelet of Pond Lilies and Lotus and other aquatics was almost submerged with a vigorous growth of Algae, when in their finest growth and bloom. Will some one tell me what to do to destroy the hydra-headed monster?—G. N. C.

### Disease of Heliotrope.

What causes the black spots on Heliotropes and how to get rid of them?—P. G.

### How to Grow Ginger.

Will some one give the soil best adapted to the culture of the ginger plant (Zingiber officinale).—H. V. B., Fla.

### Are Bees Necessary for Cucumbers?

This is my second winter raising tomatoes and cucumbers. Tomatoes are well along and I shall plant cucumbers at once. Now is it all important to have a hive of bees for my cucumbers? I note what Mr. Hale says in regard to English cucumbers, page 742, also Mr. Fraser's remarks on page 793 as regards bees for tomatoes. I take no stock in Mr. Fraser. He may be right, but I never saw a bee on a tomato blossom.

Have all our cucumber growers got into a rut and keep a hive of bees because some one else does?

This is quite an important question,

and the growers should know which is right. I cannot take the risk of running my house without the bees in the absence of positive advice.

Why should English cucumbers grow and White Spine not is the question? Please answer.—W. H. BROOKS, Me.

[We believe that it is necessary to insure fertilization of the American type of cucumbers. As to the use of bees for tomatoes, we know that nothing is gained by their assistance.—ED.]

## Criticisms on Tomatoes.

To the Editor of American Gardening.

It is with pleasure I reply to Mr. Fraser (page 795) concerning Eclipse tomato as grown here. I can speak of its merits only: demerits it has none. In examining the trusses of Eclipse to-day, I find they run from five to twelve fruits to the truss; although there has been considerable dull weather this month, I find this variety setting freely with perfect shaped fruit. Another thing in favor of this variety up to this writing is that not a speck of disease has appeared on the foliage.

Nicholson's Hybrid I am not acquainted with and lastly I don't use any bees! WM. TURNER, N. Y.

## What Is Profitable Lettuce Forcing.

To the Editor of American Gardening.

I notice on page 774 of AMERICAN GARDENING of November 13, that Wm. Thompson in his article on the Forcing of Lettuce in Winter, states six successful crops of lettuce can be raised easily throughout the winter. I would really like to know whether by successful he also means profitable?

What weight does he calculate to be a marketable size for the Boston Market and Grand Rapids lettuces?

As I have only benches to raise lettuce, I grow the Grand Rapids. My first crop this season (125 dozen) is all out of the way, and the second crop has been started from November 6 to 25. My first crop was planted 7x8½ inches and the heads weighed 8 to 10½ ounces. It was grown in from 65 to 75 days from the seed. I think I will be doing well if the next crop matures in 90 days.

Does Mr. Thompson have a house purposely to start his plants in? If not, how would it be possible for him to grow the six crops in six months? His plants must be at least two months old when they are transplanted the last time, or they would not make marketable heads in 80 days.

Would it not take up half the room of a greenhouse to raise plants that are large enough to transplant and mature in 80 days? If such be the case, or that you have to start your plants in another house, where is the profit?

Again Mr. Thompson says "my first sowing of seed was made September 5, and 70 dozen heads were sold by the end of December. Most of us would have to sell more than that to pay for the coal used. Does he mean to say that it took from September 5 until the end of December to come to a head? I don't suppose he does, but probably that was the result of two or three sowings. Let him please give us the facts and see if six successful crops can be raised with profit.

My own limited experience has shown me that the more water that a plant will absorb the faster it will grow, and that a sun heat of 80 to 90 degrees for lettuce is none too high and the more water it will then absorb. Is this not so? W. R. MESEROLE.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere

## Our 1898 Art Calendar.

We have a few thousand copies still on hand, but would advise those who are thinking of getting one to write promptly. See advertisement on page 828.

Read what a few of the recipients think about it:

Your 1898 Art Calendar received. Thanks for your promptness and please allow me to say that I consider it an exquisite work of art. However, I was not surprised, for I always look for the best of everything when it comes from you, and so far I have never been disappointed.—F. S. MULLER, Ala.

Your Calendar received and it is truly an "Art" Calendar. Any beauty-loving person would surely be pleased with it. It is an ornament anywhere.—E. L. PRICE, Ia.

Your 1898 Calendar was received in good shape. It is really a gem. I find it both useful and ornamental and it has given great pleasure to my family and myself.—JNO. FARRELL, N. J.

Am very much pleased with your Art Calendar. It is very fine and an ornament to the home.—JAY BUSHNELL, Mich.

Your 1898 Art Calendar is beautiful, and a fine adornment to any home. I was very happily surprised when I received it, for I had not expected so choice a work of art.—(MRS.) A. L. CLARK, Mass.

The Calendar recently ordered is received and I am very much pleased with it. It is as represented, and I feel sure that its receipt must not only please, but surprise all that you are able to give such an artistic and expensive work of art on such liberal terms.—JAS. L. JACOBS, N. Y.

Your Calendar came to me duly. It is really quite artistic; many of the flowers look as if hand-painted and are quite true to nature.—C. H. SHEPARD, N. Y.

The Art Calendar has given me every satisfaction. It is very useful and pretty. No home should be without one.—JNO. THATCHER, Pa.

I am in receipt of your handsome Art Calendar for 1898. It is beautiful in design and a pretty ornament, in fact, it is all and more than you claim for it.—JNO. H. PARROTT, Md.

Your Art Calendar for 1898 is fully up to the publisher's representations. My people are delighted with it and have given it a prominent place in our parlor.—THOS. J. OBERLIN, Pa.

Your Art Calendar for 1896 was received; many thanks for same. The pictures look like water color paintings. It should adorn every home.—LEVI BELL, N. Y.

Your Art Calendar duly received. I am very much pleased with same, for which accept my thanks.—M. D. GILES, Mass.

My family all admire the Calendar you sent. It is beautiful enough to adorn any parlor, and also eminently useful.—J. B. TREFETHEN, Mass.

Your Art Calendar is much more beautiful than I expected.—RICHARD VALENTINE, Wis.

I received the beautiful Art Calendar and am very much pleased with it.—GUS H. MINX, Ind.

Your Calendar for 1898, which you present to all subscribers, new and old, has come to hand. I may truly say that it is all your represent it to be and more too; it is simply beautiful in its embellishments of Roses and maidens.—JNO. GROB, Ill.

The Calendar you sent is beyond expression. It is the most beautiful work of art for a calendar I ever came across.—J. J. THOMAS, Colo.

The Calendar sent me by you is a work of art and of no mean order of merit. It has the best place in my library, giving it precedence over any other calendar I have, and I value it very highly. It should be an inducement, with the many others that you have, of subscribing for AMERICAN GARDENING. Accept my thanks for same.—G. H. SADELSON, N. C.

## There is Not a Home in the Land

But calls for a yearly Calendar.

Every family tries to get one or more; generally more.

## There are Calendars and Calendars

Some are good, some bad, most of them indifferent.

## There Will Not be a Calendar Issued for 1898

To exceed in artistic elegance, finish, beauty of designs and effective coloring, the one we to-day offer as a premium to every subscription to AMERICAN GARDENING received before December 31, 1897.

# EVERY SUBSCRIBER IS ENTITLED TO ONE

AND CAN EASILY EARN TWENTY.

OUR magnificent **Rose and Girl 1898** six sheet **Art Calendar**, two months to a sheet, each sheet  $8\frac{1}{2} \times 11\frac{1}{4}$  inches, is superbly lithographed in eleven colors, and printed on hammered paper; the whole tastefully tied with silk bow—undoubtedly a work of art fit for the most elegant home, and as handsome a Calendar as was ever published. Each one of the six designs presents a distinct type of female loveliness and a fresh study in roses, the coloring on each sheet being rendered in harmony with the design. There is not a line of advertising on the Calendars to detract from their value. They will not be sold by us for less than \$1.00 each.

### Description

### Who is Entitled to a Calendar?

**EVERY SUBSCRIBER** renewing before **December 31, 1897**, enclosing Five Cents additional to pay packing and postage.

**EVERY NEW SUBSCRIPTION**—To induce people to test the value of AMERICAN GARDENING we will send the Calendar absolutely free to every name received direct not previously on our mailing list. Remit \$1.00 for A. G. 12 months.

**EVERY ONE** sending us a club of Four 3-month trial subscriptions at twenty-five cents each, will get a Calendar, free as a premium, by return mail.

**EVERY NEW name sent in by an agent.**

NOTE.—We have ordered manufactured for us a large stock of these superb Calendars in the endeavor to have sufficient supply for all demands, but will not guarantee to fill orders after supply is exhausted. Therefore, order yours now.

### Special to Agents

A copy of our Art Calendar to show people will clinch the argument and obtain the subscription. Bona fide Agents will be mailed one copy, securely wrapped, on receipt of only Twenty-five cents (one-fourth its value.) Armed with this superb Calendar we misjudge human nature greatly if any ordinary mortal cannot secure a big list of new subscriptions every day. Every new subscriber you send us gets a Calendar by return mail.

### We Pay Agents

Every new subscription at \$1.00 entitles the agent to **Five of the Wonderful Henry Strawberry Plants**, to be delivered next Spring. Thus 100 new subscriptions would secure agents 500 plants; a possession worthy of your consideration. Every new subscriber taken by agent will receive one of our Art Calendars free by return mail.

Agents who do not want the Henry Strawberry Plants can retain as their payment **20 cents in cash** on each subscription they take, or will be credited **twenty-five cents** on any book, magazine or publication they wish to obtain through us.

correspondence

**AMERICAN GARDENING, P. O. Box 1697, New York.**

REMIT BY P. O. or EXPRESS MONEY ORDER—IT IS SAFEST.

## PRIVATE GARDENERS.

### Appointments and Doings.

Gardeners and others knowing of recent appointments and movements are requested to forward particulars of the same for publication in this column. No charge is made.

Samuel J. Trepass as gardener to J. R. Maxwell, Esq., Glen Cove, L. I., N. Y. Mr. Trepass was lately in partnership with H. M. Sanders at Spokane, Wash., as a florist.

Lance-Corporal Patrick Milne, the brave piper who continued playing "Cock of the North" on his pipes after being bowled over by a shot in each leg, in the famous charge at Dargal, on the Indian frontier, is a native of Ardoyne near Inch, Aberdeenshire, where his father was a small farmer. The latter is now gardener at Waterside, Newburgh, in the same county. Young Milne first smelt powder at the battle of Malakand, and in the next encounter of the same campaign he again had a narrow escape, while a bullet through the pipe-bag silenced his music.

### Death of William Grey.

In the death of William Grey we have lost one of the most prominent and most respected gardeners of the day. He was indeed a *doyen* of the old school.

William Grey, who died on November 25 at his home on the Corning farm, Albany, N. Y., was a Scotchman, born at Greenlaw, Berwickshire, February 18, 1828. When still young, in the spring of 1851 he came to the United States and spent a time in the nurseries of James Wilson, Lydias street, Albany. He was gardener to Mr. Joel Rathbone, at Kenwood, for about a year and later started westward, settling in western Iowa, intending to become a nurseryman, but finding the winters too severe returned again to the East, and accepted a position as head gardener to Mr. John T. Norton, of Farmington, Conn., where he remained about four years, after which time he was in charge of the choice collections of Gen. J. F. Rathbone until engaged as superintendent by the late Hon. Erastus Corning. Here he had remained until his death, and here too he did his life's work.

The deceased was a great lover of Orchids and the collection under his charge was one of the most famous and noted in existence and was rich in choice hybrids that had been raised on the place.

Mr. Grey was also a well-known entomologist and spent many years in pursuit of this study, his collection embracing over 80,000 specimens was rich in perfect specimens and in many cases types, and were obtained from all parts of the globe; especially was it rich in Sphingidae, Noctuidae and Melanitic and Dimorphic forms.

He leaves behind a wife, three sons (all in the profession), and two daughters. His many friends will learn with regret of his death which occurred after a short illness.

### Newport, R. I.

At a meeting of the Horticultural Society, held November 24, four new members were elected which makes a total of forty-two received since October 1. The question discussed was "Should the decision of the judges be final?" referring to committees on awards employed at the regular meetings and exhibitions of the Society. The majority seemed to favor the affirmative providing awards were made according to a scale of points adopted by the Society.

A certificate of merit was awarded to a new plant, a seedling from *Schismatoglottis Roebelina*, differing from the parent in having narrower leaves, and being of a dropping habit, the coloring of the leaf being similar to the parent. Exhibited by MacLellan.

### Morganton, N. C.

The annual Chrysanthemum exhibition

at the State Hospital, Morganton, N. C., was held November 3, in the hall of the Hospital to which the general public were admitted from 1 P. M. to 6 P. M., and the patients from 6:30 till 9 P. M. There was an attendance of about 1,800 people, including 700 patients, and with the small space at our disposal cramped us pretty badly. Tables were arranged on both sides of the hall on which were placed most of our foliage plants such as *Lantana Borbonica*, *Livistona*; *Phoenix reclinata*, *rupicola*, and *syvestris*, *Cuculigo recurvata*, and *Pandanus utilis*, seven feet through; we also had two pots of *Psidium Cattleyanum* (Guava) in fruit, interspersed here and there were several hundred *Chrysanthemums* all the best blooms being reserved for the center table; some of our best blooms this year were Mrs. J. H. Starin, Philadelphia, Mutual Friend, Mrs. G. Magee, Bonnie Marjory, Col. W. B. Smith, Good Gracious, Golden Wedding, Geo. W. Childs, Domination, E. G. Hill, Fisher's Torch, Gov. Matthews, G. Bramhall, Helen Bloodgood, Major Bonaffon, Modesto, Marion Henderson, Mrs. E. O. Wolcott, Mrs. F. Gordon Dexter, Mrs. McK. Twombly, Pluto, Portia, Signal Light, The Queen, Trilby, Wm. Simpson, and Yellow Queen. Mrs. J. H. Starin measured 10 1/4 inches across; we had 3,500 blooms on exhibition in 167 varieties. The varieties of Roses we grow here are Bride, Bridesmaid, Meteor, K. A. Victoria, Perle des Jardins, Souv. du Pres. Carnot, La France, Belle Siebrecht, American Beauty. We had several ferns such as *Cibotium Schellii*, *Davallia Mooreana*, *Davallia Filensis plumosa*, and two pans of *Adiantum Williamsii*.—A. R. MACLACHLAN.

[Some excellent photographs of the display accompany the foregoing notes.—ED.]

### Chrysanthemum Society of America.

#### Secretary's Official Report.

At the meetings in November, seedlings were passed upon by the committees as follows:

BOSTON, November 2.

Grace E. French, exhibited by Geo. Hollis, South Weymouth, Mass., creamy white, reflexed, scored 87 points.

November 6.

Frank Hardy (imported), exhibited by A. Herrington, Madison, N. J., white, Japanese incurved, scored 94 points.

Pennsylvania, exhibited by Hugh Graham, Philadelphia, Pa., sulphur-yellow, Japanese incurved, scored 90 points.

Kineo, exhibited by C. S. Goddard, est., Woodford, Me., yellow, shaded orange, reflexed, scored 80 points.

Ophis same exhibitor, deep yellow, Japanese, scored 84 points.

NEW YORK, November 6.

Frank Hardy, exhibited by A. Herrington, Madison, N. J., white, Japanese incurved, scored 95 points.

Pennsylvania (sport from Philadelphia), exhibited by Hugh Graham, Philadelphia, canary-yellow, Japanese incurved, scored 90 points.

CINCINNATI, Nov. 6.

No. 57, exhibited by N. Smith & Son, Adrian, Mich., Japanese, straw yellow, shading to white; scored, commercial scale, 73 points.

mixed, named, vase of 12 pink (Vivian-Morel) single specimen (Mrs. Jerome Jones); vase of 50 blooms mixed and vase of 25 mixed. Donald MacGregor, gardener to Mr. E. H. R. Lyman, Northampton, made a good showing of well-grown flowers in several classes, taking a goodly share of the prizes.

Of the commercial growers, A. N. Pierson, of Cromwell, Conn., led in quantity and quality. His 12 vases of six flowers each were given first; the varieties were: Minnie Wanamaker, Maud Dean, Mrs. G. M. Pullman, Queen, W. H. Lincoln, Major Bonaffon, Mrs. Perrin, Erminda, Mrs. Jerome Jones, Vivian-Morel, Mayflower, and H. E. Widener. Several other classes were equally well filled. His vase of Major Bonaffon led all yellows, John Barr's being a very close second. Mr. Pierson's vase of Mrs. Perrin (50 blooms) took first in class 231.

Mr. E. H. Howland, of Holyoke, put up the best exhibit he has ever staged; his gardener, Mr. Sinclair, may well feel proud of his efforts. In the class for white, Mr. Howland took first with Niveus; this was a grand vase. In Mr. Howland's general exhibit was a vase of Peter Kay, new with us. From this season's experience it is a good keeper, full flower, and in every way a satisfactory variety to grow.

John Coombs, of Hartford, Conn., made a good showing, Queen, Mrs. F. H. Secomb, Marion Cleveland, being among the best. Mr. Coombs received several prizes.

Plants were scarce. The specimens from Mrs. B. P. Cheney were as perfect and uniform as possible, taking first. E. H. Howland, of Holyoke, took first for 6, 12, and 25 single bloom plants, and second for standard. A. Laudsted first for standard. In the class not open to professionals, Mrs. Justin Spaulding, of Chicopee, took first on three and one bush plants.

The inter-state classes were not filled as well as last year, but many of the flowers were of better quality. Mrs. B. P. Cheney (John Barr, gardener) took first for Massachusetts, also the capital prize. Robert Laurie, Newport, took first for Rhode Island; Nathan Smith & Son, Adrian, first for Michigan; and A. N. Pierson first for state of Connecticut. The flowers staged for the Massachusetts exhibit were Mayflower, John Shrimpton, Eugene Dailledouze, Maud Dean and Inter-Ocean, magnificent specimens. Mr. Pierson's state entry was a close second; he staged for this class Maud Dean, Major Bonaffon, Vivian-Morel, Minnie Wanamaker, and Niveus. His Niveus were the best in the hall. Of the Michigan state exhibit, Philadelphia appeared to best advantage, and Mrs. Jerome Jones and Mme. Hoste in the Rhode Island entry.

Several seedlings were entered, although none scored the required 85 points to entitle them to an entry in class 229. Two were granted diplomas: one was a yellow marked P. 2, the other an old-gold and red marked S. 3. These were raised and entered by Alexander MacLellan, Newport, R. I. This last variety mentioned was quite unlike anything on exhibition, and as a decorative flower I think it has a place.

Mr. J. J. Van Alen's gardener, Arthur Griffin, Newport, R. I., sent for exhibition his Begonia semperflorens hybrids.

E. H. Howland had an interesting collection of pompon and anemone flowered chrysanthemums for exhibition. E. D. Shaw, of Holyoke, arranged two tables of roses, carnations, chrysanthemums, ferns, palms, etc., from Rosemont, for exhibition only. His roses were the admiration of the throng.

**Wilmington, N. C.**

At the chrysanthemum show held here in the Young Men's Christian Association rooms, first prize for the finest display of pot and cut chrysanthemums went to Will Rehder, as did the prize for the finest display of cut chrysanthemums. The premium for the finest grown chrysanthemums, one or more blooms, was captured by Lat Williams, of Wilson; and the one for the finest miscellaneous display of cut and pot flowers and plants by Miss Lucy B. Moore.

## The Window Garden.

### The Value and Culture of the Cyclamen.

The value of the Cyclamen to the florist, as a plant to sell in bud and bloom may be seen from this fact: Last week, several vases of cut Cyclamen blooms were seen for the first time at a flower show, notwithstanding the fact that these bulbs have been grown in quantity for at least one or two decades. It is doubtful whether another plant could be named which has the value of the Cyclamen in flower to both florist and amateur.

In the first place, it is a clean plant; it is also a handsome one, especially in the giganteum forms, with their beautifully marked foliage. It is a compact grower, and besides being clean from insects as a rule, it is also easily freed from the little dust which may settle on the glossy, but broad leaves. All this praise may be given it before mentioning the fine blooming qualities of the plant, or the beauty of the blooms. Add that it does not require much sunshine, and you have a category of good qualities unexcelled, if approached. The small and narrow-petaled form of *C. persicum*, which we once thought so delightful, has been superseded in favor by the far finer giganteum forms, but the Cyclamen is a perpetual monument to the patience and care of the florist in that all the newer forms have been evolved by selection and culture from the original *C. persicum*. The butterfly, or fringed form, the crested ones, and the doubles may or may not prove more beautiful and popular than the older Cyclamen as we have known it for a decade past; but in any case, it is worth while to secure the knowledge of this plant's susceptibility to change of form, and that knowledge is a prophecy of interesting and probably useful things to come.

When all this has been said, it is remarkable indeed that we may go further, and affirm that the plant is one of the easiest to grow from seed, the only qualifying phrase needed being to the effect that a good stock of patience must be laid in with the stock of seed. The bulbs are extremely slow of growth, and it is probably this fact which has given rise to the idea that they are difficult of management. We have never found them in the least difficult; but there are two points to be noted which are quite likely to be overlooked by the general grower. One of these is that the best season for sowing the seed is not that usually most devoted to seed sowing, viz., early spring. Even at the most rapid rate of growth, it is rare to get these bulbs in bloom under 14 or 15 months, and in order to bring them on when bloom is most wanted, the seed is best sown in late summer or early fall.

The other most frequent cause of failure comes from a misinterpretation of the directions concerning the resting period. The bulbs are not to be dried to the point of severe shriveling, but merely not to be encouraged in any way to growth during the period when they ought to rest. They may be planted outside during summer, after having bloomed, and have been known to flourish for almost a decade of years, under this treatment, growing better with each passing year. It is the more general custom, however, to procure new corms every second or third year, either from seed or by direct purchase.

Some failures with this favorite have been due to the fear of injuring the bulbs by the use of fertilizer. Care in selection is certainly necessary, but well-decayed cow manure is good for Cyclamens, and soot water may be used in reasonable quantity, after the buds are well started, if not before. Rough bits of coarse-graveled mortar, known as mortar rubble, from old masonry, are considered a good addition to the sandy soil used for potting the Cyclamen.

Publishers AMERICAN GARDENING:

Gentlemen—It may interest you to learn that my advertisement in your paper brought me customers from Mexico, New Zealand, Canada, New Brunswick and Manitoba, as well as from our own country.

F. L. WRIGHT, Mich.

November 19, 1897.

Our publishers will supply any book wanted. Send your orders.

We Call on every reader to secure us at least one new subscription now to **AMERICAN GARDENING** for 1898, so they will not miss any of the following offers and inducements:

## Prospectus for 1898

### All the Good Things Continued

Which have made **AMERICAN GARDENING** the standard publication of the Horticultural world, and given it more bona fide subscribers than all other Horticultural papers combined.

### Cash Prizes Offered Every Week

For Photographs of Well-grown Specimens (flower, fruit, vegetable or plant), with description as to how the result depicted was attained—from start to finish.

### Cash Prizes Offered Every Week

For Best Answers to Question Box. This department is absolutely free, and there is no necessity for any reader to remain in ignorance on any subject which may puzzle him.

### Colored Art Supplement Every Month

Free to every subscriber.—Beauties all. Every one values a good picture. Ours will be more than good.

### Cash Prize for Best Essay

On a Subject of General Interest. One Prize every month.—This feature we expect to prove a drawing card.

### Literary Supplement Monthly

Special Feature for Advanced Readers, containing articles of more permanent and scientific interest.

### New Writers on New Subjects

Which we know our readers will appreciate.

And with all this

**Array of  
Attractions**

## We Give Premiums

To those who obtain us a new subscription as well as to the new subscriber. See advertising columns.

Don't fritter away your time and money on worthless reading. Subscribe to a practical publication, admitted by all the standard authority of the age and country. Take our advice: Talk American Gardening to your friends, get their subscriptions, and they will bless you evermore.

### Situations Wanted.

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

SITUATION wanted, as gardener's assistant, has had 5 years' experience. Address: Assistant, care American Gardening.

### FOR SALE.

Advertisements not to exceed eighty words will be inserted under this heading at TWO CENTS PER WORD each insertion, payable in advance.

The address will be charged as part of the advt., and each initial, or a number, counts as one word. No cuts or display type allowed.

STRAWBERRIES, Potato Seeds. Wm. A. Olds, Okemos, Mich.

GLASS at wholesale, rock bottom prices. Also paint for greenhouses. The Reed Glass & Paint Co., 456 W. Broadway, New York.

L. C. BOBBINK, Rutherford, N. J.—Dutch Bulbs, Clematis, Magnolias, Rhododendrons, Azaleas, etc. Branch of the Horticultural Company, Boskoop, Holland.

DIRECT from the grower, duty free. Hulsebosch Brothers' Seed, Bulb, and Plant Catalogue is now out, prices very reasonable, anybody who has not received a copy should address Hulsebosch Bros., Englewood, N. J.

**A \$7.00 GIVEN FREE**  
to each person interested in  
subscribing to the Eugene  
Field Monument Souvenir  
Fund. Subscriptions as low  
as \$1.00 will entitle the donor  
to this handsome volume  
(cloth bound, size 8 x 11) as  
a souvenir certificate of his  
contribution to the fund toward  
building a monument to the  
Beloved Poet of Childhood.  
But for the noble contributions  
of the world's greatest artists  
this book could not have been  
manufactured for less than \$7.  
Address: EUGENE FIELD MONUMENT SOUVENIR FUND,  
425 East Dearborn Building, Chicago, Ill.

## DO YOU NEED WATCHING?

Or, to put it another way,

### Do You Need a Watch?

We sell them, sell them at such an exceedingly low price that you can't afford to go watchless.

Got 'em all sizes and styles.

But we'll just mention two:

An Elgin or Waltham Watch, best movement made, hunting case, accurate time-keeper, handsomely engraved, Dwyer Case, heavily gold-plated—last for all time. Ladies' or gentleman's size.

We'll send it to your address with privilege of examination. If it's not entirely as represented, send it back—costs you nothing. If you like it, pay the agent express charges and \$6.50. That's fair. Or this—

A Hunting Case Watch—beautifully engraved case, first-class movement, any size, heavily plated (14k)—looks just like a \$45.00 gold watch—keeps as good time as any of them. Sent to your express agent with privilege of examination—same conditions as all our watches sent out—and if you like it, pay him \$8.45 and express charges.

If you take our word for it, and send money with order, a handsome chain goes with either, and express charges are paid by us, for the prices named above.

**Royal Manufacturing Co.**

334 Dearborn St., CHICAGO

**Horticultural Books.**—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send sc. stamp for our new catalogue.

## The Bee Keeper.

### Location of the Apiary.

If possible the apiary should be so located that we have the hives in plain view from the house or workshop so we can watch them during the swarming season without extra trouble. A properly arranged apiary is a pleasing sight, in fact, an ornament on the lawn.

Select a plot of good solid well under drained sod and arrange the hives systematically thereon. It makes little difference which way the hives face, though if convenient I prefer to have the entrances face southeast.

The rows of hives can be arranged to conform with the surroundings, or the hives can be scattered irregularly among larger shrubbery and trees, but the semi-circular arrangement generally makes the finest appearance. The hives should then be about five feet apart in the row and the rows about ten feet apart, with three passages running across the rows. This arrangement with nice white hives on a green lawn gives a fine effect.

So much for beauty; now for utility. It is well to have a wind-break on the north and west sides. In the early spring the rough winds are very hard on the bees, and I have frequently noticed that hives sheltered from the north and west wind build up faster in the spring than those not so sheltered. Evergreens appropriately arranged make a splendid and slightly wind-break.

If you are compelled to locate the bees close to the street or public road that is much used, the bees are a nuisance to the passers-by, and the passers-by to the bees. The best plan then is to have a tight fence seven or eight feet high between the street and apiary. Bees are of such a disposition that they will not tolerate any one to stumble around in front of their door when they are busy rushing out and in after their work. If they fly against some one or notice quick motions in front of the entrance, they will often resent it and generally trouble will follow. For that reason I recommend a screen between them and the street. In the crowded city lovers of the bee sometimes make a success of a small apiary on top of a house.

The foregoing hints are of course for the readers who desire to add bee-keeping to their other pursuits as a matter of recreation and incidentally profit. If a person desire to make apiculture his sole calling, then the choice of a location becomes quite a different question which I will not discuss now.

High trees close to the hives are not to be recommended unless the queens are clipped, as it is almost impossible to hive a swarm if they cluster on a tall tree. As a rule, they prefer low shrubbery if it is at hand.

Dense shade is not desirable, as it causes dampness in the early spring when the bees are benefited by the sunshine; a little shade during the hottest season is desirable though. I use a shade board on the hive and when I desire the heat of the sunshine for the bees' benefit I remove the shade board. Properly managed, grape vines make a very good shade, look ornamental and bear luscious fruit. L. W. LIGHTY, Adams Co., Pa.

The Manhattan (Kas.) Horticultural Society held its November meeting at the college and listened to a practical and interesting paper from Miss Bertha Kimball on "Winter Collection of Insects." Miss Kimball told how to collect and destroy some insects that are injurious to the fruit grower.

Mrs. Joshua Hendricks, N. Y., begs to state that she was very much pleased with your 1898 Art Calendar and hopes you will be able to dispose of a large supply.

I received the beautiful Calendar for 1898. It is very fine and an adornment for any home or place where they love those things which remind them of the beauties of the Creator. I would not part with it for many times its cost.—THOMAS HANDLEY, Ontario.

## The Poultry Yard.

### Fertile Eggs from Yarded Birds.

A wail of woe comes to one of our best poultry papers—it is not a new thing, but is voiced with more than the usual discouragement—concerning infertile eggs. The writer says that he has never had an egg from a pen of yarded fowls to hatch. There certainly is no reason for such failure as this, except such as may be found in the ignorance of the inquirer. It is true that there is often some trouble in getting hatchable eggs from close-housed fowls, very early, but this is the most that has to be admitted along this line. We have known of repeated instances during the past season in which whole clutches have hatched, the eggs being wholly from yarded fowls. Vigor, meat, green food, and exercise are the specifics.

### Keeping Bantams.

The idea is prevalent that Bantams are useless, except as pets for children, and as money-makers for the fancier. There is a light in which these pigmies may appear quite profitable, however. Where space is scanty, one may keep Bantams where there is not enough room for Leghorns, even, for small families, one of these would make just enough to cook, while a larger bird would be quite too much. Invalids, too, might enjoy a small bird of this sort, especially as the proportion of breast meat is large. There are many varieties of Bantams besides the tiny Sebrights so commonly seen. The buff Pekins are quite sizeable, and lay eggs rather closely approaching those of some of the Mediterranean breeds in size.

### Crowding on the Roosts.

One of the greatest problems among poultry growers is to find means to keep the young chicks, the ducklings, the feeding birds, the roosting birds, from crowding. It is foreign to their nature to go in such large flocks as are seen under artificial conditions, and one of the first effects is a tendency to active crowding. More than one breeder has come to the conclusion that crowding at night, with consequent sweating during the earlier hours, and chilling towards morning is a most prolific cause of roup. Firmly-built roosts, all on the same level, are a help, but often not a sufficient one. A simple and very shrewd idea along this line is to make the roosts several inches wide, set them on edge, and saw out three-inch notches in the roost between each two birds. The birds roost on the "teeth" which are six inches wide, and of course straight along the top edge.

M. V. NORYS.

## MEEHAN'S MONTHLY

**Of Interest** not only to the amateur gardener, the botanist and the scientist, but also to every lover of horticulture and nature. The name alone is sufficient guarantee of the high standard of this horticultural magazine, its editor, Thomas Meehan, formerly having edited the famous "Flowers and Ferns of the U. S.," and the well and favorably known "Gardener's Monthly." The concise, instructive, and practical articles made it popular from the first, and few of its class have been so universally well received and so widely quoted.

**The Leading Feature** the colored plate of some native flower or fern, executed in Prang's finest style, and the chapter relating thereto, is by itself well worth the subscription price. Two dollars a year. Sample free.

# WHOLESALE MARKET REPORT.

## New York.

Social events of importance are now taking place with great frequency in this city. Consequently, there has been a general advance in values in the cut flower market since our last report. There has also been a falling off in supply which has still further helped to bring the market over to favor the grower, a circumstance which has not happened for many months before.

In Roses other than American Beauty there has been an advance of more than 200 per cent. Bride, Bridesmaid, and Meteor, No. 2 grade, have advanced from \$1 to \$3 per 100; No. 1 grade to \$5 and \$6 per 100; specials and fancy make \$8 to \$12 per 100. The top figure for Beauty is \$35 per 100.

Violets did rise to \$2 and a few to \$2.50 and \$3 per 100, but are now weakening so much that \$1.50 is frequently the taking price.

Carnations are meeting with good demand at \$1.50 to \$2.25 for standard varieties and \$3 to \$5 per 100 for fancies and novelties.

Lily of the Valley is firm at \$3 and \$4 per 100. Lillium Harrisii is meeting with slow sales with \$8 per 100 as top figures.

Thanksgiving business proved most beneficial to the grower and producer. The market cleaned out well in all lines of stock. Poultry proved better than was expected; apples did well, and all

kinds of hothouse stock cleared to advantage. Since then there has been the usual decline which follows a holiday, but in no way can there be said to be a slump.

Hothouse grapes (Gros Colmar, imported) realized \$1 per pound; Alicante found no favor and remains unsold.

Tomatoes sold out clean at prices varying from 20 to 80c.

Mushrooms make 50c. to 60c. per pound, if of fancy quality, inferior grade 40c. per pound.

Cucumbers 60c. to 75c. per dozen, demand only medium.

Lettuce 50c. per dozen for No. 1 quality; lower grades sell low as \$1 per barrel.

Radishes \$2.50 to \$3 per 100 bunches. Apples—Albamar Pippin, Va., poor to fair, \$2@2.50; good to fancy, \$3.50@5; Wine Sap, Va., poor to fair, \$2@2.50; good to fancy, \$3@4; Johnson's Winter, Va., poor to fair, \$2@2.50; good to fancy, \$3@4; King, State, poor to fair, \$2@2.50; good to fancy, \$3@4; Ben Davis, Western, poor to fair, \$2@2.25; good to fancy, \$2.50@3.25; Greening, State, poor to fair, \$1.75@2.25; good to fancy, \$2.50@3.50; Baldwin, State, poor to fair, \$1.75@2.25; good to fancy, \$2.50@3; N. Spy, State, poor to fair, \$1.75@2.25; good to fancy, \$2.50@4; mixed lots, poor to fair, \$1.50@2; good to fancy, \$2.25@3.

Pears—Seckel, State, per bushel box, \$1@2; Beurré Bosc, per barrel, \$2@3.50; Lawrence, per barrel, \$1.50@2.50;

Beurré Clairgeau, per barrel, \$2@3; Beurré d'Anjou, per barrel, \$1.75@2.50; Vicar, per barrel, \$1.25@1.75.

Grapes—Catavba, fancy, per small basket, 9@11c.; ordinary, per small basket, 7@8c.; Concord, fancy, per small basket, 8@8½c.; ordinary, per small basket, 7@7½c.; white kinds, in trays, per 100 pounds, \$1@1.25; Catawba and Concord, in trays, per 100 pounds, 80c. @ \$1.15; very inferior, per 100 pounds, 50@75c.

Nuts—Hickory, steady at \$1.50@1.75 per bushel; chestnuts, the market is given over all most entirely to imported (Spanish.) These are for the most part wormy and arrived heated, consequently the price is low. They are being sold off wagons in the street and by fakirs at 8c. per pound.

Brussels sprouts—Per quart, 4@8c. Cauliflowers—Fancy, per barrel, \$2.50@3; fair to prime, per barrel, \$1.50@2; culls, per barrel, \$1.

Celery—Choice to fancy, large, per dozen, 25@30c.; fair to prime, per dozen, 20@25c.; small, per dozen, 10@15c.

Cabbages—Jersey and Long Island, per 100, \$3@3.50; State, per 100, \$2.50@3.

Cucumbers—Florida, per crate, \$1@1.25.

Carrots—Unwashed, per barrel, 75@90c.

Onions—Orange Co., red, prime, per bag, \$1.75@2.25; Orange Co., yellow, per bag, \$1.50@2; Orange Co., white, per bag, \$1.50@3.75; Orange Co., inferior, per bag, \$1@1.25; State and west, yellow, flat hoops, \$1.25@1.75; State and western, yellow, bulk, per barrel, \$1.75@2; eastern, white, per barrel, \$2.50@3; eastern, red, per barrel, \$2.75@3; eastern, yellow, per barrel, \$2@2.25.

String beans—Charleston wax, prime, bushel basket, 75c. @ \$1.50; Charleston, green, per bushel basket, 60c. @ \$1.25; Florida, wax, per basket, 50c. @ \$1.25; Florida, green, per basket, 50@75c.

Squash—Hubbard, per barrel, \$1.25@1.50; Marrow, per barrel, \$1@1.25.

Spinach, Balt., per barrel, \$1@1.25.

Tomatoes—Florida, per carrier, \$2@3.50.

Turnips—Russia, Can., car lots, per barrel, 50@75c.

Potatoes—Long Island, in bulk, per barrel, \$2.25@2.75; Jersey, choice, round, in bulk, per barrel, \$2.12@2.25; fair to good, in bulk, per barrel, \$1.75@2; fair to prime, per sack, \$1.75@2.12; State and western, choice, in bulk, per 180 pounds, \$2.25@2.35; western, fair to good, per 180 pounds, \$2@2.12; fair to prime, per sack, \$2@2.25.

Turkeys—Jersey and up-river, fancy, per pound, 13@14c.; Maryland and Delaware, fancy, 13@14c.; Maryland and Delaware, good to prime, 11@12c.; State and Penn., fancy, per pound 12@13c.; western, good to prime, pound 10½@11½c.

Ducks—Western, fancy, per pound, 8@9c.

Geese—Maryland, prime, per pound, 9@10c.; western, prime, 8@9c.; western, fair to good, per pound, 6@8c.

## Boston.

Boston market celery remains unchanged at \$1.50@1.75 a dozen; other grades such as Parish, Golden and Arlington find a slow sale about 50c.

More call for all kinds of squash. Marrow \$1.50 a barrel; Hubbard \$1.50@1.75 a barrel; Turban \$1.50; Bay States cook well, but don't seem to please, find a fair demand at \$1.25 a barrel.

Onions hold their own at \$2.25 a barrel. White, French or yellow turnips \$1 a barrel; flat purple top 75c. @ \$1.

Radishes 25c. a dozen; mint 50c. a dozen; oyster plant 75c. dozen bunches.

Duchess pears limited in quantity, \$2 a bushel. Beurré Bosc a wide range, \$3@5 a bushel; Clairgeau \$2.50@3.50; Beurré d'Anjou \$1.50@2.50.

Brussels sprouts 10@15c. a quart. Okra \$2 for a six-basket carrier.

String beans \$2 a bushel. Lettuce is generally light headed, fancy, well headed; would likely bring 50c. a dozen quick; the general arrivals varying in quality, sell from 25@50c.

Mushrooms 60@75c. a pound, broilers

# NERVOUS BREAKDOWN

It Comes to the Preacher from Over Study and Brain Tire—It Comes to Any Person, too, who Worries and Frets.

From the Huron Tribune, Bad Axe, Mich.

A "breaking down of the nervous system" is a modern expression—a modern complaint. It is induced by prolonged strain and the overtaxing of the nervous system, and is a product of over hurry and hustle. It affects the preacher and the lawyer—the direct result of brain tire. It affects people in any walk of life, too, who worry and fret. It means a depletion of the nerve forces.

It is curable by complete rest and change of scene, also by the use of nerve restoratives and nerve foods. As the first method is not within the reach of all, the latter offers the most universal and practical method of treating the complaint. When it is determined that medicine is to be used, select that one which contains the most nerve-nourishing properties. Do not take nerve tonics. They only stimulate, and the reaction leaves you worse than you were before. Select the medicine that is to the nerves what meat is to the body—one that as it builds up the nerves, also increases your weight. The best thing for the purpose is Dr. Williams' Pink Pills for Pale People, the reputation of which is built up by solid and indisputable proof and which is known in every hamlet in the country.

As a proof of its merits in such cases, read the following letter of a clergyman:

DR. WILLIAMS' MED. CO.,

Schenectady, N. Y.

Dear Sirs:—In April, 1896, I was a hopeless case, owing to a complete breaking down of my nervous system and to a persistent stomach trouble. I had been treated by a great many physicians but received no permanent benefit. I had been down four times with nervous prostration and twice with gastritis. These attacks would come with such violence as to throw me into spasms. The time came when physicians said I must stop preaching or die. I would be so exhausted after the last service on Sunday that I could scarcely get from the pulpit. Many a time I have had to sit down and rest before I could leave the church in order to gain a little strength.

I could eat neither meat nor vegetables. I dared not allow my bare feet to as much as touch the cold carpet or floor, to say nothing of taking a cold foot bath. If I did I was immediately seized with cramps. In this condition I commenced to take Dr. Williams' Pink Pills for Pale People. I took one box and felt no better—in fact worse. I said I would take no more, but my wife urged the matter, feeling my life depended upon the result, as everything else had failed, and I was "used up." I therefore continued to take them. Since then, and it has been several months, I have had but one slight attack and have enjoyed life. Have preached all summer and held revival meetings for fifteen weeks. During that time my wife was sick seven weeks, so that my rest was much broken. Some nights I did not sleep at all. I have had no muscular exercise for years until recently, when I have done some work in my garden, and my muscles stand the test remarkably well. I can eat anything I desire, and can now enjoy a cold bath daily. Every Sabbath I preach three times, and now think I am good for another twenty years if the Lord wills. I am surprised at myself and sometimes think it cannot be possible that I have accomplished what I have.

(Signed) "REV. J. N. MCCREADY,

Elkton, Mich."

Find attached, the affidavit of Mr. McCready, made before a notary public.

J. N. McCready being duly sworn, says that the above and foregoing statements made by him are true. Subscribed and sworn to before me this 23d day of July, 1897.

J. D. BROOKER, Notary Public.

All the elements necessary to give new life and richness to the blood and restore shattered nerves are contained in Dr. Williams' Pink Pills for Pale People. They are for sale by all druggists, or may be had by mail from Dr. Williams' Medicine Company, Schenectady, N. Y., for 50c. a box, or six boxes for \$2.50.

# OUR CLUB LIST

LET US FILL YOUR ORDERS FOR 1898.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

75c. a pound. Tomatoes, hothouse, 25 @30c. a pound.

Gros Colmar grapes bring 30@50c. a pound, largely on account of their showiness. Hamburgs, better eating, but not quite so fine looking, sell 30@50c.

Potatoes firmer 30@85c. for Green Mountains, 75@80c. for Hebrons, White Stars 75@78c.; Red stock ranging from 60@75c. Cloth-head sweet potatoes generally lower, Virginia stock, \$1.25@1.75. Jersey double-headed barrels \$2.25.

Spinach 25@40c. a bushel. Beets 50@75c. a bushel. Carrots 75c.@\$1. Parsnips 50@75c. Parsley 75c. Artichokes \$1.50. Leeks have lost none of their strength since Thanksgiving and are steady 40@50c. a dozen bunches. Cabbage firmer and easily bring 4c. a head.

Cauliflower scarce and in quick demand, \$2 a dozen. Cucumbers slower prices inclined downward at present taking a range of 4@6c. each.

Cranberries steady \$5@7 a barrel; crates \$1.75@2.25, with occasionally some fancy bringing \$2.50. Egg plants \$3 a dozen.

Apples firmer all around. Greenings taking a range of \$2.75@3.25. Readers must remember that the quality of Baldwins and Greenings this year is not what it usually is. Baldwins selling \$3@3.50. Some fancy Maine Spies bringing \$4. Missouri Jonathans \$4@4.25; Ben Davis \$2.75@3.25. Lady apples in half-barrel kegs, \$2.50. Maine King selected stock \$4. Tallman Sweets \$3; Pound Sweets about gone by, what few coming easily bring \$3@4.

## Philadelphia.

There has been a larger demand for foreign grapes this past week, owing to the holiday trade, but prices have not advanced. One dollar per pound for European and from 60 to 80c. for local-grown have been the ruling figures.

There has been a good demand for choice apples, and consignments have been closely sold up; the medium and low grades of stock are in the majority. Choice fruit is not being offered freely. Prices have been: Kings, choice and fancy, per barrel, \$3.25@3.50. Wine-saps, choice, per barrel, \$3@3.25; fair to good, \$2.25@2.75. Ben Davis, choice, per barrel, \$2.75@3; fair to good, \$1.80@2.25. Rome Beauty, choice and fancy, per barrel, \$3@3.25; fair to good, \$2@2.75. Greenings, choice, per barrel, \$2.75@3; fair to good, \$2@2.50. Baldwins and Spies, choice, \$2.75@3; fair to good, \$2@2.50. Mixed varieties, per barrel, \$2@2.50.

Grapes are yet plentiful, but sales have fallen off very much. N. Y. Concord, per 5-pound basket, realizes 8@9c.; per 10-pound basket, 12@13c. Niagara, per 5-pound basket, 9@11c. Catawba, per 5-pound basket, 7@8c.

Cranberries, Cape Cod, choice, per barrel, \$8@9; medium, \$6@7; per crate, \$1.75@2.50; Jersey, per crate, \$1.25@1.75.

Florida oranges, per box, \$3@3.50. Brussels sprouts, per quart, 5@6c. Cauliflowers, choice, per barrel, \$2@2.25; fair to good, per barrel, \$1.50@1.75. Cabbages, Jersey, per 100, averaging 6 to 8 pounds per head, \$2@2.25, averaging 4 to 6 pounds, \$1.50@2; lighter heads \$1@1.25.

Celery, choice, large, per dozen, 25@35c.; fair to good, per dozen, 15@20c.

Egg plant, Florida, per one-half barrel box, \$2.50@3.

Onions, choice stock, in better demand and firmer, but most of the stock offered is of inferior grade. Yellow, per barrel, \$1.75@2.25; per bushel 65@70c.; fair to good, per bushel, 50@55c. White, per barrel, \$2.50@3.25.

String beans, Charleston, green, per basket, 75c.@\$1.50; do. wax, per basket, \$1@1.75. Florida, green, per box, 50c. to 75c.; do. wax, per box, 75c.@\$1.

Potatoes remain quiet and prices are unchanged from last week's quotations.

Sweet potatoes, Jersey, quiet and firm, per basket, 50@55c. Southern are in large supply and being worked off at low prices, the highest being 30@40c. per basket.

Address all Orders to AMERICAN GARDENING, P. O. Box 1897, New York.

# The Henry Strawberry!

**To Meet** The extraordinary demand for this unequalled Strawberry we are preparing 100,000 Henry plants for delivery through next Spring to

## Premium Earners

Henry Strawberry Plants can be obtained solely through a subscription to AMERICAN GARDENING; as the publishers will not sell plants under any consideration;

Neither will Mr. Jerolaman who has signed a contract with us to that effect.

## Who is Entitled to Plants

### NEW SUBS. AND RENEWALS

Five plants of the Henry will be mailed, postpaid, as a premium to every Renewal or New Subscriber sending us \$1.00 a year's subscription. When remitting be sure to state if you want this premium.

### TO AGENTS AND WORKERS

For every \$1.00 received from agents and present subscribers for New Subscriptions, we mail, postpaid, Ten Henry plants, Five to the New Subscriber and Five to the Agent.

## Special to Club Raisers!

### CLUBS OF TEN

To every agent sending us in a club of Ten New Names and \$10.00 we will forward in payment therefor One Hundred (100) Henry Strawberry Plants, by express, as well as send Five plants, postpaid, to each person in the club.

All orders are now held for Spring Delivery....

The series of articles on "Big Berries for All," written by Mr. H. Jerolaman for AMERICAN GARDENING, with additions, will soon be in pamphlet form; and agents and friends will be supplied with copies on receipt of stamp. It will be the most unique pamphlet on the Strawberry ever issued.

FIG. 228.—COPPER BEECH TREE IN THE BOSTON PUBLIC GARDENS.

To obtain the form shown, it is necessary to induce branches by pinching out the leader.

## Peaches and Nectarines Under Glass.\*

(Concluded from last week.)

The principal secret in starting an early peach house is "start easy." Supposing we start a house the middle of December; we have some dreary weather to go through, can give our trees lots of time, and have ripe peaches the first week in May with such varieties as Hale's Early and Rivers' Early. And in starting a fruit house give a thorough watering, making sure that the border gets a soaking from top to bottom, with a wet surface and a dry bottom, the results will be anything but satisfactory.

When starting a peach house in, say, the middle of December, I consider a night temperature of 40 degrees, with a rise from 5 to 10 degrees during the day, is sufficient for the first two weeks; then rise to 45 degrees at night with the day temperature 50 or 55 degrees with sun. This should carry them until the fruit is well set, when a temperature of 50 degrees at night will do no harm, raising the day temperature accordingly.

In forcing early peaches and nectarines, we should always avoid coddling, or in other words, give air at every available chance, the trees will be benefited, and give stronger blossoms, which means finer fruits. At the same time use judgment in airing an early fruit house. We may sometimes go into a fruit house and find it warmer than it should be, but in such a case it would be poor policy to rush on lots of air; sudden changes must be avoided or we may expect to find our fruit lying on the borders during the stoning period, instead of on the trees where they belong.

It is well to go over the trees when they are in bloom, using a camel's-hair brush to distribute the pollen, especially if there be no bees around, and bees are somewhat scarce at the end of January, which would be about the time a peach tree would be in bloom, if started the middle of December.

Fruit forcing demands the closest attention if we are to have satisfactory results, but having a good houseful of peaches and nectarines, the grower is well repaid for a little extra trouble earlier in the season. I never tire of looking at a good house of fruit, and on the other hand, if the showing is poor, I feel like locking the door. Fruit trees are interesting objects from the time they are started until the fruit is ripe. What a glorious sight is a peach house in flower in midwinter. 'Tis a picture anyone can admire!

When the trees are in flower it is necessary to keep a dryer atmosphere, but a damping done once during the day in bright weather will do no harm, providing there is plenty of air on.

When the fruit is set, syringe twice a day in bright weather. Of course I don't believe in syringing anything in cloudy weather. The plants are happier with a dry coat.

In presenting a paper on this subject, it is not necessary to go into every little detail, they are so numerous, but I will just mention a few as I go on. One important point is disbudding, which requires attention from time to time: there

are just two ways for this operation, the right and wrong, so set the best man on the place at this work; it needs time and patience with good judgment. Disbudding and thinning of the shoots should be done by degrees; it is better than taking off a large quantity at once. A tree well cared for during the summer months as regards thinning the wood, cutting away rank growth, etc., needs very little pruning in winter.

Peach trees have a tendency to make rank wood. We can control that somewhat when the shoots are selected. For instance, a shoot is selected from the upper part of the fruiting wood and another from below, and nine times out of ten the shoot on top will make a rank growth, while that from the under side will be just right for fruiting wood. I select wood for the following season as much as possible from the under side of the fruiting wood. When going over the trees disbudding, a large number of shoots will be found that can't be rubbed off on account of fruit, but all those that are not needed for the growth, can be plucked, say three or four leaves from the fruit, which will induce the formation of spurs; those spurs we can safely rely on for some of our finest fruit, both for flavor and appearance.

My advice is when there is fruit on the spur wood to leave it to mature, but of course, should there be a cluster on a spur—and there often is—thin down to one.

Thinning is probably the hardest task of all for the gardener. It is difficult not to leave on too many. Peaches and nectarines are deceiving, when in a small state, and one is easily led astray, and leaves on too big a crop. If the trees carry a very heavy crop, the quality is poor, and the trees are also damaged. I have heard it is not safe to thin too much until the fruit is stoned, but my practice is to do all the thinning at the first swelling. I maintain that when a peach has done stoning, the work is nearly complete, and to have extra fine fruit thinning should be done in the early stage.

There cannot be any set rule as regards the number of fruits a tree shall carry; it depends to a certain extent on the condition of the tree. Trees that are inclined to make rank growth, crop the heavier. Experience and close observation should soon teach one what the trees are capable of maturing. Peaches in tubs, you have them more under control than when planted out, and I usually crop them more heavily. Having the roots confined, one can feed them heavily, and it is remarkable what results can be had from a tub tree, and with good care they will last for years. We have tub trees six and seven years old, capable of carrying a hundred fruits or more. The wood is perfect and they are probably good for years. The method I have read of, fruiting trees for three years then dump them, I cannot agree with. I can safely say, when I have had a tree in a pot or tub three years. It is just getting into good shape; however, if we all thought alike, our progress would be slow.

The next point to be considered and an important one, is foliage. It is impossible to have fine fruit without good foliage, and the question as to how to get it can be answered in a few words. Green fly and red spider are two of the

greatest enemies, but my advice is to apply the remedy before there is much damage done; there is an excuse for the presence of a little fly when the trees are in flower, but after that period, none! The force pump should be used once or twice a week from the time it is safe to syringe after the fruit is set, until it begins to get ripe, syringing with enough whale-oil soap in the water to just color it. With such treatment there will be fine healthy, leathery foliage. Green fly, spider, and all insects will give the peach house a wide berth, if the whale-oil soap is used. It is a simple remedy, but effective.

In bringing my few notes to a close, I would say if there is any re-planting to be done in a peach house, there is no better time than just as the trees are dropping their leaves. I always find it handy to have a few trees on hand, in case of an accident; half a dozen trees can be planted in the garden, trained fan-shaped, and then should anything go wrong with any of the trees in the house they can be replaced with trees ready for cropping.

Peaches and nectarines should be on the plum stock for forcing.

## As to Forcing Lettuce.

To the Editor of American Gardening.

On page 774 Mr. Thompson tells how he grows first-class lettuce, and says the temperature should be between 50 and 60 degrees. I would like to know, if that is for night or day or both. And he says water should be given freely on all bright days overhead with a moderate sprinkler, and "after dark weather, when the sun shines brightly," the lettuce should be sprinkled lightly overhead two or three times daily.

What does he mean by "dark weather when the sun shines brightly?" What is the use of watering two or three times daily? Would not one good watering underneath be better, that is, by sub-irrigation? The Ohio Experiment Station says that is the right way to water lettuce.

I am a beginner and would like to know the best way to grow lettuce. I have a house 20x40, planted it the first week in October, and it is not yet ready for market. I water by sub-irrigation about once a week; the soil seems wet enough, but the crop does not grow very fast. I am using manure water out of the barnyard; do you think the water too cold, or is my house too cold? I have let it run as low as 40 degrees at night; is that too cold for best results?

Would nitrate of soda be better than the manure water? If so, how much should I use at each watering?

Now, Mr. Editor, I know this is a long letter, and a great many questions are asked, but I would like to be able to grow six successful crops in one winter as Mr. Thompson does.

ED. SCHRICKEL, O.

[The temperature should not go below 40 degrees.—En.]

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere

\*Paper by W. Turner before the Dutchess Co. Horticultural Society, Dec. 1, 1897.

### Some New Implements.

We illustrate a few of the novelties in implements as used in Great Britain, including a motor van, for which we are indebted to the Agricultural Engineer, of London, and which may be interesting to our readers.

Lawn mowers are operated by steam, the illustration being of the "Sumner" patent. The engine and boiler are fitted on the machine so that the bulk of the weight is on the main roller and the machine being nearly balanced is easy to turn. The boiler is multitubular, containing 60 copper tubes, and a copper fire-box, the shell being made of mild steel and the whole tested by hydraulic pressure to 30 pounds. The safety-valve is set to work at 150 pounds. Water is fed to the boiler by a brass force pump, and is first passed through a heater and delivered to the boiler at a temperature of about 180. Steam is generated in the boiler by the use of ordinary lamp oil as fuel, which is burned in the fire-box of the boiler by a burner similar to the burner of a naphtha lamp. Oil is forced to the burner by compressed air at a pressure of about 15 pounds. By this means, it is claimed, perfect combustion is obtained without smell or smoke, and steam is generated quickly. The oil and water are carried in the cylinder immediately in front of the engine. The engine and boiler are well proportioned, apparently well made, and suitable for the work they have to do. Among the advantages claimed for this steam lawn mower are, first of all, cheapness; one man can always work it, whereas two are often required to work a machine with a pony or horse; then, it is said, the machine can be turned quicker, and go in and out among the beds and borders better than with a horse or man pulling at the front; the mowing can be done in much less time; consequently lawns can be mown oftener and kept in better order; no damage to borders, no marks left by horses' boots; the additional weight on the machine rolls the ground at the same time that it is mown, so that mowing and rolling are done at one operation, and the ground is rolled every time it is mown; there is no slipping of the rollers. It is also available as a small portable engine for driving any kind of light machinery, such as shaft cut-

machine and horses. The seat is readily detached so that now one pattern machine only is necessary, as the seat can be on or off at the pleasure of the user.

The "Ransom" potato digger is made so that, instead of the digging tines being rigidly fixed in the rotary wheel, they are at the right moment made to turn partially round. This is accomplished by governing the tines by a cam, giving them a feathering or self-clearing action. The

FIG. 231.—"SUMNER" STEAM LAWN MOWER

advantage of this is that the tines can be made well hooked to go under and raise the potatoes with the least possible power, and that on coming out of the soil, the feathering action, which then turns the hooked point of the tines downwards and backwards, delivers the potatoes on the top of the soil and frees the tines of the tops and haulms. This action which is absolutely new, gets over the great difficulty there has always been before that, if the tines were made the right shape for lifting the potatoes they were the wrong shape for dropping and clearing the potato haulms and weeds.

The Lancashire prize motor van is a rear driven, four-wheel vehicle built upon a steel frame. It is fitted with a vertical compound engine of the marine type supplied with steam from multitubular boiler. The boiler, which is oil fired, is of steel, and has 108 copper tubes of a special make and a copper fire-box having a total heating surface of 50 square feet. The connection to the engine is by steam dome which is so placed that the steam is thoroughly dried, therefore priming is absolutely prevented. The crank shaft which revolves in one direction only, is connected with the second motion shaft on which suitable clutch gearing is fixed by four changes of speed, viz., "high," "intermediate," "slow," and "reverse." The second motion shaft transmits the power to the third motion shaft on which the driving chain pinions are fixed, and also the compensating gear. The gearing being of tough gun metal with machine-cut teeth is exceedingly powerful. The power is

applied to the road wheels by means of powerful pitch chains, being kept taut by means of radius rods. The whole arrangement of boiler, engine, and gearing is so placed that the weight on the driving wheels when empty is about half the weight of the van, and as all the additional weight when loaded comes on to the drivers a proportionately better grip

is obtained. By this means the weight on the steering wheels is kept constant and the van, it is claimed, can be easily managed by one man. The body of the van, which is of great capacity, and occupies the rear portion, is separated from the boiler by a partition which does not obstruct the rear view of the driver. The van is roofed with sheet metal. The condenser, which consists of a number of brass tubes of special make, is supported above it. The metal roof is arranged so that any rain-fall may be carried to the storage tank and used as feed water. Both cylinders of the engine may be worked high pressure when necessary. The regulating lever after shutting off steam also applies the brake. The clutch levers, etc., are all within easy reach of the driver.

### Weevils in Seed Beans.

A reader sends specimens of seed beans together with some insects he has found on them, and asks: "Do you think it will impair the vitality of the bean? At first only a discolored spot shows on the bean, in a few days the full-grown bug emerges. Is there any way to overcome it?"

The seed beans sent are infested with the common bean weevil (*Bruchus obtectus*). Such beans are injured for seed purposes. Part of the infested beans will grow fairly well, but many of them

FIG. 232.—"RANSOME" POTATO DIGGER.

will simply germinate and then die. Furthermore, if left to themselves the beetles will continue to breed upon the dry beans and soon change the beans to a worthless mass of meal. At one time it was thought that the bean weevil deposited its eggs only in the green beans while in the pod. It is now known that the beetles will deposit their eggs upon dry beans and that they will feed upon these throughout the whole season. The number of broods produced each year is variable, as is also the time required for a brood to develop from the egg to the adult beetle. Under favorable conditions the time has been found to be 21 days, while under adverse conditions the time required to complete the life cycle is often 80 days.

The simplest and most inexpensive method of getting rid of this pest is to use bisulphide of carbon. This is a colorless fluid with a disagreeable smell. It is frequently sold by seedsmen and dealers in insecticides under the name of "Fumacarbon bisulphide." One and a half pounds of this substance should be used to every ton of seed, or if a whole building is fumigated use about two pounds

FIG. 230.—"CALEDONIAN" POTATO DIGGER.

ters, churning, pumping, small lathes, dynamos, etc.

The "Caledonian" potato digger is somewhat different from those in this country. It has a seat which is supported by an arm fixed to the end of the main frame, conveniently placed on the left side of the machine and is very handy for the driver to exercise control of both

to every 1,000 cubic feet of space. If the beans are in bags the latter may be placed in a tight box and covered with canvas or oil cloth. The bisulphide of carbon should be poured into shallow dishes and the latter set on top of the seed. Exposed to the open air this fluid changes to a gas that is heavier than air, hence it penetrates throughout the mass of seed and suffocates the insects.

*Remember that carbon bisulphide is explosive, so do not attempt to smoke while using it, nor carry a lighted lamp into a room filled with the fumes, nor use it in a room where there is a fire. Also remember that it will suffocate human beings as well as it will insects, so avoid breathing the fumes as much as possible while using it.*

F. A. SIRRINE.

## The Fruit Garden.

### Gaining Time.

On sunny days when the frost is not severe, work over the fruits in rotation, beginning on the pears, currants, etc., and finishing last in spring on the stone fruits, plums, and peaches, preferring to push the season now rather than to have it crowd you in the spring, when lots of unlooked for detail work turns up.

### Pruning Currants.

Overhaul the bushes and cut out some of the oldest wood where too thick and cut about one-third from the extra strong growths of the past summer, not forgetting there is some individuality even in currants.

In cutting upright growers as Victoria, Cherry, or Versailles, let the top bud be pointing outward and on the under side, but in Fay's make the cut so that the bud is on the upper side.

### Thinning the Gooseberry Bushes.

These, if grown in bush form, should have some thinning out of the oldest wood, cutting back one-third of the strongest summer growth and cutting

FIG. 232.—IMPROVED FRUIT CRATES

out entirely the weak or small wood, so that there will be no crowding in summer.

When grown in this way, it is easy to obtain a supply of young plants; it also calls for a good mulch in summer as well to keep the fruit clean.

The tree form or single stem is more in vogue on the "other side" and some elaborately shaped heads are worked out by retaining leading shoots and pinching the side growths in summer, or pruning back to spurs in winter. This style seems to be more successful there than it is here, where the stem often gets dry and suddenly breaks off at the surface after a few years; on the other hand, I have come across a few patches where there seems to be no difficulty whatever.

The soil most suitable here is a strong moist loam, mulching in summer and lots of manure once a year.

### Raspberries.

The weak and all surplus canes should be cut out, and the covering of tender kinds seen to, if not already done. Clean up all brush and make ashes of it.

J. HOLLOWAY, L. I.

## Improved Fruit Crates.

Some time ago AMERICAN GARDENING illustrated an excellent set of fruit crates, which were low and broad and capable of being piled one upon another. They were, in fact, the crates shown in the accompanying illustration, with this exception: These have one end piece pinned at the top, so that the bottom of this end piece can swing out when it is desired to empty the crate. It is easy to see that this will cause less bruising than when the crate is upset in the usual way. The end is held in place when closed by a bottom, or by a curved bit of iron, having a screw thread where it enters the wood. It could also be closed by a pin through the side of the crate into the end of the swinging piece.

## The Vegetable Garden.

### Time for Reflection.

For all practical purposes there is little that can be accomplished in the garden at this season; the crops are gathered in and stored for the winter, the ground is all cleared of rubbish and either plowed or dug, to be left to the purifying influences of frost and snow. In moist weather such ground should not be walked upon, as this will counteract this sweetening process.

When our garden is covered with snow, we know how well it protects vegetation and adds nitrogen to the soil. Let us aid bounteous Nature all we can, and when the wintry winds do blow, take things easy, and do what reflection we can.

In this rush and tumble and hurried method of our present mode of living, we are apt to think we are a smart and progressive people. Each year we are confronted with new varieties of vegetables and flowers, etc. And we are assured they are superior to those cultivated before. We have reason to think, however, that the onion of to-day is practically the same that was enjoyed by our ancestors of 4,000 years ago, that was eaten by the great nabobs of old, and there is hardly a home in this land where this old quaint vegetable is not used and esteemed.

The same may be said of the cabbage, beans, cucumbers, egg plants. These were known and cultivated long before the days of Julius Cæsar, Romulus, or Homer. Could the history of these simple vegetables be written, that were used at the tables of the great and the humble of unrealized ages, what countless revolutions and changes in our methods of living could we learn from them.

Garden vegetables are no doubt in a large degree the best foods of man. Let us, therefore, keep on improving our varieties, methods of growing, try new kinds, take more interest in this, the natural vocation of man, and grow more, eat more, that we may become better

men socially, intellectually, and industrially.

W. M. EDWARDS.

## Foreign Correspondence.

### Origin of the Gandavensis Gladiolus.

To the Editor of American Gardening.

You are right in supposing the term *Gladiolus gandavensis* to be derived from Gand (Ghent). It was the late Mr. Louis van Houtte, the well-known Ghent nurseryman, who gave this name to a hybrid *Gladiolus* offered for the first

FIG. 233.—"LANCASHIRE" MOTOR CAR.  
(See page 839).

time to the trade by him in the year 1841. I have before me Mr. Van Houtte's catalogue No. 6 (autumn, 1841) in which he offers *Gladiolus gandavensis* as the novelty of the year, at 25 francs (\$5) for medium sized, and at 70 francs (\$14) for very strong bulbs. The first colored plate with elaborate description appeared in the *Flore des Serres*, March, 1846, where the hybrid is stated to have originated from a cross between the Cape species *Gladiolus peltatinus* and *G. cardinalis*, in the gardens of the Duke of Aremberg at Ghent.

This *Gladiolus gandavensis* created a sensation but was soon surpassed by numbers of seedlings which have since been offered under fancy names. A complete collection of *gandavensis* hybrids from 1841 to the present day would embrace many thousands of named varieties, some fifty and more new names being annually added by various raisers. The old varieties, with a few exceptions are entirely abandoned now, and the standard of the whole section is still improving from time to time. The old type of 1841 is still used as a cheap bedding variety, although it is rather poor, compared with the majority of other cheap varieties.

The term "*gandavensis*" nowadays refers to the whole section; but when no varietal name is added, the old type is meant.

More recent sections of late flowering garden *Gladioli* have been termed: *Lemoinei*, *nancelanus*, *Childsi*, etc., which all have their distinct characters relative to their origin.

ERNST H. KRELAGE,

Haarlem, Holland.

## THE READERS' CLUB

REPLIES TO THE PROBLEMS IN THE  
QUESTION BOX.

### Turnips Are Bitter.

(To C. B. W., page 811).—Growing these in close proximity to horse radish will not make them bitter; that is caused through lack of sufficient potash in the soil. An application of wood ashes for growing turnips improves their taste. I have known some cooks to soak such turnips in water containing a little lye, before boiling, and to add a little pinch of lye to the water while boiling. It was said this improved their taste.—W. M. E.

### Growing Cinerarias.

Cinerarias will not drop their foliage unless the treatment has been wrong, which may be defined as lack of drainage, too much liquid manure before pots are filled with roots, too much water will also have the same effect, or they may be infested with red spider.

There are no plants so sensitive to or requiring more care in watering than these. They should never be allowed to become too dry, for they will rarely recover. They should be potted in one part leaf mould, two parts turfy loam, and one part each of sand and decomposed cow dung, a sprinkling of powdered charcoal is also an advantage, particularly when the plants are small with few roots. Give plenty of drainage, at least one-third pot full of broken pots or similar material; pot firmly. Water sparingly until active growth sets in. The first potting should be into 2½-inch pots, as soon as these are filled with roots, shift them to 8½ or 4 inch, and again into 5 and 6-inch pots, in which size they may be allowed to flower.

When the pots are full of roots with plenty of foliage, give a little liquid manure, weak at first, after watering them first with clear water. Never give liquid manure when the plants are dry at the roots. Keep enough moisture in the house to prevent red spider, keep down aphids, ventilate freely, do not allow them to be crowded, keep temperature 45 to 65 degrees.—W. M. EDWARDS.

Growing Cinerarias in a temperature of 80 degrees is something new to me (see page 811); then dropping from 80 degrees to 40 degrees would be unsatisfactory to any growing plant. With such a temperature I should judge the plants would grow up spindly and weak.

To grow Cinerarias satisfactorily, a temperature of 40 degrees at night with a rise of 10 degrees during the day would be nearer the mark. The Cineraria being a "cold-blooded" plant should be grown in a house with plenty of fresh air to keep it robust. With such treatment I think the leaves will cease to damp off.—WM. TURNER.

### Why Cinerarias Drop Foliage.

Replying to G. Schretzmeir, page 811, would say that if his Cinerarias are in the vigorous condition he says they are, he need not worry about their losing a few of their under leaves, as they are very apt to do so, especially if kept in a close

atmosphere, and set too close together.

If G. S. will try to keep a temperature of say 45 to 50 degrees at night with 10 higher during the daytime, a good circulation of air when possible, and keep the plants shifted on as they need it, he will, I think, have no trouble with dropping of leaves.—J. M.

### Rhubarb in the Home.

The plant itself is not raised in cellars, but in the open ground. Any one having good strong roots growing in the garden, can very easily enjoy his plant during the winter months. In the fall before the ground freezes, dig up all the roots required, leaving them exposed or covered very lightly with leaves, until needed for forcing. Place a few roots in any structure where the temperature does not fall below 50 degrees.

I have seen it grown in the cottages of the lowly as well as in the middle class in Europe for Christmas pie. It grows nicely if roots are put in the bottom of a barrel, as close together as it can be put without crushing, just covering the roots with enough light sandy soil to keep in the moisture. The barrel is then placed in any out-of-the-way corner, in the house or cellar where above temperature is maintained, and in two or three weeks rhubarb pie can be enjoyed; I have seen such a barrel in the bay window of well-to-do people; it is sometimes covered with any odd drapery that may always be found in a cottage, a board placed on top and Geraniums and Fuchsias placed there to flower all winter to lend a cheerfulness, while nice rhubarb for the palate is growing underneath. Such combinations are cheerful to the housewife while outside the winds and snow make things desolate and uncomfortable.—W. M. EDWARDS.

### Rhubarb in Cellars.

Rhubarb forces readily in a temperature of from 60 to 70 degrees. All that is needed is to keep the crowns dark and supply some moisture to the roots. The stool or crowns should be lifted and stored away under an open shed or covered with boards. Retain a portion of the soil if possible to keep the roots plump. When placed in position for forcing cover lightly with soil up to the crown, sprinkle with water and afterwards maintain a moderate degree of moisture.

Darken with sacks or shutters and so continue until the rhubarb is ready for pulling. As the spring of the year advances less artificial heat is required. The cellars referred to on page 811 were heated with hot water pipes placed for the purpose. Bins or divisions are constructed to make covering easy and also to enable one to force in batches.—ED. A. G.

### Gladiolus for Forcing.

Shakespeare is the variety most generally forced for the New York market.—ED. A. G.

### Medicinal Properties of Native Plants.

The Medical Botany of United States, by Laurence Johnson, published by Wm. Wood & Co., is the best thing of the kind, though far from complete. Mirsch's Ma-

teria Medica (Lea Bros. & Co.), Sayre's Materia Medica, and Culbreth's Materia Medica are also excellent, but they include those of other countries.—H. H. RUSBY.

### Propagating Small Fruits.

One of the easiest ways to increase blackberry plants is to allow them to sucker or throw up their shoots naturally, but one of the best ways if only a few hundred are wanted is to take a common spade, sharpen with a cross-cut file, and when the sucker plants are six to ten inches high, force the spade down on each side of shoot so that a cross root six inches long will be left on the plant. This "severed" root will throw out a nice lot of fibrous roots in the latter part of the growing season which will make fine plants. Another method is to grow the plants from root cuttings, which appeared in AMERICAN GARDENING last week.

Increase red raspberries in the same manner as blackberries, but if you have had no experience in growing red raspberry root cuttings, it will pay you best to grow "severed" root plants. The purple and blackcaps can be increased by layering the tips in the month of August to September 15, by taking the hoe or trowel and burying the tip three inches deep in the soil.

Propagate currants by taking cuttings from vigorous shoots of the present season's growth, cutting in lengths of from six to ten inches, place in sharp sand during winter where there is no frost (a cellar or pit will be a good place). Plant in well-prepared ground, in April, against the land side of a furrow six inches deep which is marked out with a one-horse garden plow; the soil should be well firmed against the cuttings, especially the lower half of them.—C. C. N.

### Disease of Egg Plants.

Replying to William on page 811, would say that for the past few seasons in this locality (Delaware Co., Pa.), we have had just such experiences, in fact, not a few of the growers here are about to give up trying to raise egg plants. My own experience the past season has been very similar to William's. Not only the leaves but also full-sized fruits instead of getting black, would turn brown and finally rot in spots until they became unfit for use.

While I cannot explain the cause or offer a remedy for the trouble I am fully convinced that good egg plant cannot be raised on worn-out land without applying some good fertilizer, such as bone or some of the good brands of phosphate now in use, in addition to the ordinary application of stable manure, and also if possible plant on new ground.

If any of the readers of AMERICAN GARDENING have had the same trouble and found a remedy they will confer a great favor to many by making it known through their valuable paper.—J. M.

### Wintering Cannas and Caladiums.

These should be kept dry in a warm cellar, or under greenhouse benches, away from any drip. If the position where they are kept is very dry, cover the roots with sand. They will keep best in a temperature of 40 to 45 degrees.—W. M. E.

Cannas and Caladiums can be wintered in a dry cellar, providing it can be kept warm enough.

When once Caladium bulbs start to rot it is a difficult matter to keep them, as the decay is rapid. There should be no trouble in storing them in a cellar, especially where there is a heater, which is generally the case.

The Cannas can be stored just as dug up in clumps, and if some soil is attached it will do no harm, in fact, I think it is beneficial. In the spring the clumps can be divided and planted on the lawn, or if preferred started in the greenhouse, then planted.—W. T.

#### Wintering Cannas.

Canna roots may be wintered in the cellar or any moderately cool, dry room where the temperature does not fall below 50 degrees Fahrenheit, or in paper bags in any room free from frost, or under the benches in the greenhouse.

They should be examined frequently, especially if stored in the cellar, to ascertain their condition, and if too dry, moistened slightly. If too damp, place in a dryer position. They are intended to remain dormant, and should not be allowed to sprout; therefore, if kept near the ground, place boards between them and the soil. If the place where they are kept is warmer than 50 degrees, they will need a little moisture to prevent them from shrivelling up. They should be well dried and wiped off well before storing.—W. B. LONGSTRETH, Ohio.

#### Primroses and Violets from Seed.

Procure fresh seeds (old seeds are not reliable), mix a sufficiency of soil, of leaf mould, turfy loam, and sand, in about equal proportions, chopped fine; procure a shallow box, about 18 inches square, making holes for drainage. Upon the bottom of this box place a layer of any coarse material, then fill to within half an inch of the top with the above compost, press solid with a brick, then water.

Upon this the seeds may be thinly scattered. Cover lightly with same compost sifted; then cover with a little chopped moss. Place in average heat of about 50 degrees. Keep the moss moist, when the seedlings appear the box should be carefully removed, placing it away from the direct sunshine. As soon as large enough, transplant. The plants just sown will not bloom next spring.—W. M. EDWARDS.

#### Gladiolus for Forcing.

Out of several varieties we tried for this purpose, the Lemoine Gladiolus proved to be the best.

In forcing these great care should be taken to use only thoroughly refined large bulbs. Ordinary bulbs grown all summer and fall should not be planted before February 1. They should be kept dormant to rest at least ten weeks after they have been dug up and thoroughly dried.

By carefully growing and ripening the bulbs that were grown after the forcing, the new bulbs will be fit to plant by December 1, as if planted February 1, next year, the new bulbs should be ripe by August 1. By the same process of early maturing, the bulbs could be ripened by

June 1 and these could be depended upon to plant in time to flower from Christmas to Easter the following year, when they are certainly an acquisition.

It is better to start them in 4-inch pots, by filling the pot first with good potting soil, then pressing one good bulb in each pot, the upper half of bulb should be exposed, if planted too deep they will rot; water thoroughly to settle, place pots in shady corner or along the walk; do not water again until fairly dry, or made good growth; at first keep from 50 to 60; after the pots are filled with roots, gradually inure to the light, and plant out in bench and treat similar to Roses. By this method they should throw from three to four spikes each, and as they can be planted close, will give a good crop of flowers.—W. M. EDWARDS.

#### List of Flowering Shrubs.

For hardy shrubs to bloom from April to October, suitable for cutting. H. S. M. has a large list to select from—I would recommend the following:

April—Amelanchier canadensis, flowers white, height 6 to 8 feet. Azalea americana, red, 1 foot. Amygdalis incana, red, 2 feet. More or less all the Berberis, yellow, average height 8 feet. Caragana jubata, white and red, 1 to 2 feet. Ceanothus azureus, blue, 8 to 10 feet. Cotoneaster buxifolia, white, 8 to 4 feet. Crataegus oxyacantha, white and red, 10 to 15 feet. Cydonia Malus, red, 2 to 5 feet. All the Daphnes, white and red, 1 to 3 feet. Deutzia gracilis, white, 1 to 2 feet. Diervilla rosea and alba, 2 to 5 feet. Kalmia latifolia, pink, 2 to 6 feet. Kerria japonica, yellow, 8 to 4 feet. Various Magnolias, white and purple, 2 to 10 feet. Prunus Pissardi, white, 10 feet. Rhododendrons, and all the Ribes more or less.

May—Nearly all the foregoing to which may be added: All the Azaleas more or less of our native kinds. Calycanthus floridus, Celastrus scandens, many kinds of Cotoneasters as also of Crataegus, Exochorda grandiflora, the Laburnums and Viburnums, Syringas, Philadelphus coronarius, etc.

June—Many of the foregoing, as also Clematis, Cornus sanguinea, Euonymus atro-purpureus, Hydrangeas, Hypericums, Jasminum officinale, Lonicera, Rhus, Robinia hispida, Yucca filamentosa (not strictly a shrub but indispensable among shrubs) and of course hardy Roses, more or less.

July—Again many of the foregoing, to which may be added Bignonia, and many more Clematis.

August—All the Spiraeas, Osmanthus fragrans, and Tamarix parviflora.

September—Calycanthus occidentalis, Clethra alnifolia, Eleagnus macrophylla, Ligustrum lucidum, and many of those mentioned as suitable for July and August.

October—There are not many more to add to flowers in the month of October; frosts, sufficiently severe, generally destroy those which are out in bloom. Hamamelis virginica, Hydrangea paniculata grandiflora, Kerria japonica, and others, usually hold their own for a short time longer, and as there are more or less annuals in flower yet in October, such as Cosmos, Ten-Weeks' Stock, Reseda, and

others, there need be no scarcity for cut flowers to decorate mantel or table.

Many of the above-mentioned shrubs will in October and nearly all through the winter months furnish us, if not with fragrant buds and flowers, something nearly as good, that is, their splendid scarlet berries which are ever refreshing and pleasing to the eye; what is, for instance, more effective than a large bush of Euonymus americana covered with berries with a background of freshly fallen snow?—MAX.

In my list of hardy summer flowering shrubs on page 824 of last issue, I, by an oversight, omitted the Japanese Viburnum, V. plicatum, which is one of the best, and flowers in June.—R. McL.

#### Vines for Piazza.

H. I. M., N. Y., wants a list of hardy vines to cover piazza posts 15 feet high.

The following is a list of hardy deciduous climbers, all good ones for his purpose:

Ampelopsis quinquefolia, foliage turns red in fall. A. tricuspidata, foliage turns red and yellow. Aristolochia sipho, Celastrus scandens, Jasminum nudiflorum, Lonicera Caprifolium, Wistaria sinensis. Hardy evergreen climbers: Hedera Helix, Jasminum officinale and revolutum, Rosa sempervirens, Smilax rotundifolia.—M.

#### Night Soil as a Fertilizer.

For anything inside night soil does not smell very good. Wm. E. Wheelock inquires how to best use it. In the first place I will answer him that he should get Harris' "Talk on Manures," which I am confident he can procure from the publishers of AMERICAN GARDENING for a small sum. I will nevertheless give him a few pointers from experience.

Down South we used to employ night soil considerably in shape of what is called "poudrette," meaning that the soil had had the moisture evaporated and so dried. Night soil is more nutritive than the dung of domestic animals, but the offensiveness in handling makes it somewhat difficult to deal with.

According to Lawes and Gilbert, an adult male voids in the course of a year, faeces, ninety-five pounds; urine, one thousand and forty-nine pounds, or one thousand one hundred and forty-four pounds of excrement in the pure state. One ton of 2,000 pounds of night soil in comparison with animal dung contains:

HUMAN MANURE }	SOLIDS.	URINE.
Nitrogen.....	20.0 lbs.	12.0 lbs.
Phosphoric Acid.....	21.8 lbs.	3.7 lbs.
Potash.....	5.0 lbs.	4.0 lbs.
HORSE, COW, SHEEP MANURE }	SOLIDS.	URINE.
Nitrogen.....	9.4 lbs.	22.5 lbs.
Phosphoric Acid.....	6.2 lbs.	0.4 lbs.
Potash.....	4.8 lbs.	25.4 lbs.

So we find that a ton of fresh human excrement contains more than twice as much nitrogen as a ton of fresh mixed animal dung. The urine of man contains nine times as much phosphoric acid as that of horses, etc., and very nearly all the nitrogen is in available condition. One hundred pounds of the dry substance of the faeces contain five pounds of nitrogen and five and one-half pounds of phosphates. One hundred pounds of the dry matter of urine contains twenty-seven pounds of nitrogen and ten and three-fourths pounds of phosphates.

Night soil should be promptly incorporated with stable manure or be mixed with dry, fine muck, or woods earth by which the ammonia will be absorbed and its offensiveness avoided. Night soil in its various forms is especially adapted to the growing of early vegetables, owing to its great solubility, and may easily be rated in comparison with cow dung as 4 to 1.—M.

#### When to Prune Wistaria.

If there is any pruning to be done on Wistaria vine, just after the blooming period would be a good time, but I could not recommend a free use of the knife on this most beautiful of all hardy climbers. To prune a Wistaria severely robs the vine to a certain extent of its grace and beauty. Spare the knife and give a liberal dressing of manure in the spring, then you will get large flowers and lots of them.—WM. TURNER.

#### Management of Pomegranate.

The Pomegranate (*Punica granatum*) of which G. L. and M. E. Campbell in-

you have a safe fertilizer. Cow dung is especially well adapted to sandy land on account of its non-heating character, and why it should not be suitable for strawberry growing may be the great quantity of nitrogen it contains, causing the plants to run too much; not so, however, on sandy soil.—M.

#### Leaves for Manure.

Nothing but time will convert leaves into leaf mold but the process may be accelerated by keeping them in as compact a heap as possible. Thoroughly wet them and try to get them in heat.—M.

#### Should the Runners Be Cut Off?

The Marie Louise Violets in cold frames, mentioned on page 811, should have some of the runners removed if the plants are crowding each other, to allow light and air around the plants. Judgment must be exercised during these short days not to remove too many from the plants to cause a check.—W. T.

main plant, they had better be shortened. It is better to pinch back the shoots before they grow too much above the plant.—W. M. EDWARDS.

### The Scurfy Bark Louse.

The scale insect sent by J. M. Fox is the common "scurfy bark louse" (*Chionaspis furfur*). This insect resembles the San Jose scale only in its method of feeding and in secreting a waxy covering. In other respects it is entirely different. It probably causes as much damage as does the San Jose scale, but it has been with us so long that we rarely notice the damage done by it. If the writer has a few choice dwarf trees infected by them he will soon discover how much damage they can do.

The "scurfy bark louse" is nearly as bad to get rid of as the San Jose scale. The best time to attack it is in the spring at the time the eggs are hatching. First wash the trees with a solution of fish-oil soap, one pound of soap to one gallon of water. This should be followed with two applications of kerosene emulsion. The soap solution should be applied as soon as the buds begin to swell. The applications of the emulsion should be made between the 20th of May and the 10th of June. In the vicinity of Leesburg, Va., probably most of the eggs of this scale are hatched by the first of June. Washing the bodies of the trees with the soap solution as late as the 10th of June will destroy large numbers of this scale insect. F. A. SIRRINE.

#### Some Clover Seed Insects in Ohio.

Complaints are coming to the Ohio Experiment Station regarding the appearance of insects in clover seed the present autumn, in such numbers as to occasion much concern among the farmers. In southern Ohio, this insect has been determined as probably the same one that has attacked clover seed in West Virginia, although it has never before been reported from Ohio. At the present time this is a very small, robust, whitish worm, that is found inside the seed. This will in time develop into a small, black, four-winged fly, but entirely different from the clover-seed midge, which is red in the maggot stage and yellow and white in the adult stage.

Several months ago two men were fined by Justice Miller at Uniontown, Pa., for malicious mischief in mutilating shade trees which they slashed while employed by the town council to trim the fire-alarm wires. They appealed from the justice's decision, and were found guilty on two counts of malicious mischief and for having repeated the offense after the first conviction. The case is of interest to other property owners whose trees have been damaged in this way.

The strawberry plants arrived in fine order due to skillful packing and were exceptionally strong and good plants.—W. H. COWING, Mass.

I am very much pleased with the paper; it is just what I had been looking for. I am very much interested in its vegetable gardening department.—F. A. B., Conn.

FIG. 234.—ACQUATIC POND IN THE BOSTON PUBLIC GARDENS.

quire in issues of November 20, is a deciduous plant, therefore will loose its leaves sooner or later; it is a native of Persia; it is even mentioned in the Bible in connection with the vine, olive, and fig tree. As old as the plant is, it is very seldom that fruits, if they do set, will ripen in this country, north or south. As an ornamental tree it is "O. K.", and there are any amount of double varieties in existence which have no earthly influence over the single varieties planted near them.—M.

#### How to Use Cow Manure.

Cow manure should be used dry. Take the droppings and pile them or lay them out not more than six inches thick, turn from time to time, till mellow enough to pulverize. Then apply to anything growing, and no one can give an overdose of that kind of manure.

If wanted for liquid fertilizer, take a three-gallon can, fill up with dry manure, fill with water, let stand 24 hours, and

#### Should Violet Runners Be Cut Off?

The Violet runners had better be cut off if fine flowers are wanted. If carefully cut off and the strongest pricked out in a shallow box in loam, leaf-mould, and sand, in about equal parts, they will make the best plants for flowering the following year. The old plants had better be burned. The cuttings should be put in the soil compactly, and as soon as rooted, to be transplanted or potted into three-inch pots, and to be planted outside in good soil in the spring. During the winter the cuttings should be kept at a temperature of 45 to 55 degrees.—W. M. E.

#### Begonia Rubra.

We always cut away any long stems that may grow on these plants, if the latter are small in size, or they will become top heavy and unshapely. If the plants are large the stems may be left to grow, but should they overbalance the

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 15, 1894.

PUBLISHED BY  
A. T. DE LA MARÉ PUBLISHING CO. LTD.  
ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.  
Telephone, 2154 Cortlandt. P. O. Box 1697.  
REGISTERED CABLE ADDRESS  
Commercial Cable) Flerex, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MACILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per space line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

**Illegitimate Opposition.** It is a delicate matter for an agricultural or horticultural publication to criticize the work of the National Department of Agriculture, and especially as regards the free seed distribution or the practically free document distribution. The natural answer to such criticisms is the general statement that such publications are jealous of the work of the government officials which results in the documents, and that they do not like the seed distribution because it interferes with their advertising patronage.

These statements are supplemented with the truism that agriculture and horticulture are getting but an insignificant share of the money which is expended annually by the government.

The motives of the editors of agricultural papers do not affect the question of the ethics, the unrighteousness of the free distribution of seeds and documents relating to farming, at the public expense. It is generally conceded that unasked government aid tends to pauperize any industry and injures rather than benefits it. The free distribution of seeds and bulletins, carries the implication that farmers and gardeners are unable or unwilling to purchase their own seeds or pay for such reading matter as they may require. We have, however, fully discussed these questions from time to time as they were suggested by current events. It must be confessed that the opposi-

tion of the government, both through the Agricultural Department, and through local experiment stations has worked serious injury to the agricultural and horticultural press. The average farmer or gardener now gets free, or at a nominal cost, books and documents, filled in some cases, we are happy to say, with timely and valuable information; but why should our readers get this information free when merchants or professional men have to get similar information relating to their business through legitimate and successful trade publications? Why should the funds of the government be used to compete with the publishers of agricultural books or papers, rather than the publishers of other kinds of literature or other trade papers?

It may be said that the books and bulletins issued by the Agricultural Department and experiment stations furnish an immense amount of copy for the agricultural press; unfortunately this is true, but it does not affect the ethics of the case. There is no more reason why the government should furnish free copy for impecunious publications than ink for their presses or the paper on which to print. A deplorable feature of the free distribution of copy which we may mention in passing is the political bias of the matter furnished. One year it is the development of the foreign market for the American producer, the next it is the protection of the home market and reciprocity.

We believe that industries are best developed by the men who are engaged in them, and especially through the special publications which presumably contain the combined wisdom, the best experience of the ablest and most successful men who are actively engaged in the particular trade or industry concerned. The government very properly allows trade publications in common with other papers special mailing facilities at low rates; ought not this to be the limit of its favoritism?

The free seed distribution and the practically free distribution of books and documents should be stopped at once and the business permitted to revert to the publishers and seedsmen, who are trying to do a legitimate business to pay their postage bills and who have to bear their share of the taxes.

And now the latest is that the Government enters into the purchase of MSS as witness the following lately issued circular:

"The Secretary of Agriculture proposes to issue a series of Farmers' Bulletins on tobacco, covering the different types and phases of the industry. In the preparation of the material for a number of the subjects the Secretary desires to secure full competition. He therefore authorizes the announcement that for the best article upon each of the subjects hereafter named, he will pay at the rate of \$15 per 1,000 words.

The papers are not to exceed 10,000 words in length, and are to be submitted to the Secretary of Agriculture not later than March 31, 1898.

Three subjects are given. If the plan is successful other subjects may be announced from time to time.

(1) Methods of cultivation; (2) Export tobaccos of Kentucky and Tennessee; (3) The marketing of tobacco, a Cigar leaf, b Manufacturing—smoking, plug, cigarettes; c Export. This should include particularly the grading and packing of the different types, with suggestions as to improvements in existing methods."

## Personal Property Tax.

and the Farmer.

"THE net result of all the comparisons made by the Ohio commissioners between city and farming districts finally goes to prove that the tax upon personal property makes farmers pay from four dollars to seven dollars where it makes the residents of large cities pay one dollar.

"Speaking generally of the effect of this Ohio scheme of taxation the Commission further says:

"The system as it is actually administered results in debauching the moral sense. It is a school of perjury. It sends large amounts of property into hiding. It drives capital in large quantities from the state. Worst of all, it imposes unjust burdens upon various classes in the community; upon the farmer in the country, all of whose property is taxed because it is tangible; upon the man who is scrupulously honest; and upon the guardian, executor, and trustee, whose accounts are matters of public record. These burdens are unjust because by the system as administered, these people pay the taxes which should be paid by their neighbors. And the commissioners finally add that 'these conclusions are in accord with all current authorities on the subject.'"

The above remarks are extracted from the last issue of Appleton's Popular Science Monthly, in which Hon. D. A. Wells has lately given a most valuable series of papers on the Principles of Taxation. Just as soon as the farmer realizes that he is made to bear in almost all cases more than his share of the national expense, just so soon will he be roused to action to secure his due recognition and rights.

## First Monthly Competition.

A cash prize of \$5 per column is offered for the most instructive practical essay on

## LETTUCE FORCING.

Manuscripts must be received at this office by January 1 and should be of about two columns in length. All MSS. submitted in this or any competition become the property of AMERICAN GARDENING.

## Answers Prize.

It is with pleasure that we announce the first award of the prize offered for the best set of answers to the letters published in one week's Question Box. For a very interesting and valuable set from Max Munte, Cambridge City, Ind., the prize of \$5.00 has been awarded.

## The Improved Appearance.

We trust all our readers will appreciate the improvements made in the present issue.

**Botany and Parks.**—A suggestion is before the authorities of the city of London, Eng., to devote a small area of each park to the purposes of a miniature botanic garden so as to assist the teaching of botany in the elementary schools.

## THE QUESTION BOX

He that questioneth much shall learn much.—BACON.

Readers are invited to forward particulars of any difficulty or perplexity that they have encountered. If the question be one of general interest it will be inserted in this column, so that other readers who may have information to impart can assist their brethren by recounting their own experiences. Questions of a purely individual interest will be replied to by the Editor under the head of "Short Answers."

Questions submitted in this department will receive the full attention of the staff of AMERICAN GARDENING and when desirable will be answered editorially.

All communications for insertion should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR of AMERICAN GARDENING, P. O. Box 1697, New York City. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query or answer are sent, each should be on a separate piece of paper.

Answers should always bear the title of the query replied to and the page on which it appeared, and our readers will greatly oblige us by advising, as far as their knowledge and observations permit, the correspondents who seek assistance. Conditions, soils, and means vary so infinitely that several answers to the same question may often be very useful, and those who reply would do well to mention the localities in which the experience was gained.

**Important to Querists.**—Correspondents must look through the whole of the paper for replies to their queries. Answers cannot always be given the week after the queries are received, but there is as little delay as possible in dealing with them.

**Cash Prizes** will be given for the best set of answers each week. Payment to be made monthly.

### Wants to Grow Strawberries.

We want to prepare an acre of corn stubble in the best shape for best results, with strawberries to be set next fall or a year from next spring, or part in fall and the remainder the following spring. This ground was an old clover field plowed this spring for the corn ground. Soil, sandy loam. Corn, a good crop. Some one, two, or three, or more; please inform how we should proceed from now, continue and conclude. If not enough space for the whole story, tell it in parts, commencing with this winter's treatment.

We have a team and a hired man; fine lake muck, ashes free, or 75 cents a load double box, at saw mill, and stable manure free, but to draw 4½ miles from village. We do not want to buy fertilizers unless at a less cost for the certainly as good or better results and profit in the end, as we are not prepared to pay any expense incurred for experiment "regardless of cost," style, or "just for the fun of the thing."—J. M. CUSHMAN, Mich.

### Hardiness of Hale Plum.

Is the Hale plum hardy in the latitude of Boston?—W. H. W.

### Is Fruit Growing in Del. Profitable?

What are the inducements offered by Delaware in the vicinity of Dover, for small fruit culture? What about markets, shipping facilities, and freight rates? If all right, what varieties of blackberries, raspberries, and currants, also of plums, pears, and quinces, should be selected? Part of the land is corn stubble and part seeded to wheat; how would you proceed to get it in the best possible condition in the shortest time; stable manure is out of the question. Undoubtedly, the tree form of currants are the easiest cultivated and kept clean, but are they as profitable otherwise?—F. C. S., New Jersey.

### Queen Chrysanthemum.

Does the Queen Chrysanthemum have an open center when fully grown? I have bought from two parties and the flowers have open centers from both sets of plants.—E. EASTERDAY.

### Fertilizers on Prairie Land.

I would like if some of your Western subscribers would tell their experience with commercial fertilizer on onion and early cabbage on prairie land, what kind of fertilizer, and how and when did they apply it.—EDGAR EASTERDAY, Ill.

### Liquid Manure for Clematis.

I have a number of Clematis plants well established—Jackmanni, Henryi, and others—and want to increase the size, number and duration of their blooms next year. With this end in view, I have this fall mulched each plant with two or three inches of cow manure. Please suggest a formula for a good liquid fertilizer to be used next summer after the plants begin to bud.

I can buy sheep manure, and by leaching it get a liquid which is doubtless good, but probably deficient in potash and some other elements. What substances should be added and how much of each? The soil is very heavy black loam.—S.

### Pruning Clematis.

Can Clematis in early spring be pruned to advantage? Would it tend to increase the number of blooming points and dwarf the upward growth if the ends of the shoots were pinched out early?—S.

### Gladiolus for Forcing.

Can Gladiolus be forced in pots in early spring? If so please name best varieties and color of bloom for this purpose.—H. M., Colo.

### Pansies for Spring Flower.

Have just transplanted a lot of Pansy plants into two-inch pots; how shall I keep them over winter, so they may bloom profusely next spring? What stimulant is best for large Pansy flowers?—H. M., Colo.

### Fenster Pappé.

Does Fenster Pappé do all that is claimed for it, as a substitute for glass? What does it weigh to the roll.—H. M., Colo.

### Double Portulacas.

Last summer I had a beautiful bed of double Portulaca. I am told that they will bloom single next season. Will some one inform me through your paper if so and why?—T. J. B.

### The Direction of the Rows.

In all directions for planting Sweet Peas, we are told the rows must run north and south. Why will not east and west answer as well? Does it make any difference in the blooming or quality of the flower?—"WADAN."

### Sowing Scillas.

What is the proper time, also the method of sowing seed of Scilla Siberica?—D. U. X.

### Japan Plums Not Fruiting.

Please tell a subscriber how to get fruit from Japan plums, Burbank and others if they are not fertile.—G. H., N. Y.

### Shading for Greenhouse.

What is the best paint or mixture to use to coat conservatory roofs where Palms are kept—something that will stand the storms well.—C. C. W.

### Weak Stem in Roses.

What is the cause of so many of my Roses having weak stems? The buds hang over, but are of good size. I keep the temperature 56 to 58 degrees at night, and not over 76 to 80 degrees through the day. The plants look very healthy.—H. W. C., Pa.

### Lettuce Dies Off.

I have had a great deal of trouble with my lettuce under glass this last two years. It dies after it is two-thirds grown, also often on first planting to finish growth, the plants fail to strike root and those that do start and attain two-thirds growth and seem to be doing all right, will in 24 hours become entirely worthless, having wilted and are tough. On pulling up the plant I find the roots are all dead to within an inch of the main root. I have lost my entire crop within two weeks in parts of my houses. Have tried all kinds of fungicides, changed my soil, and thoroughly dried my houses in summer, and still have only obtained partial relief from the trouble. Have tried common garden soil with manure, and also clear sand and manure, always with the same results.

Can the trouble be caused by some foreign substance in the soil, in the watering, ventilation, or too low or too high temperature? The wilting and dying is worse on bright sunny days than in cloudy weather.—M. L. R., Ill.

### The Availability of Liquid Manure.

How long after watering a plant with liquid cow or sheep manure, is it before said manure is in a condition to be assimilated by the plant.—JIM.

### Keeping Tuberoses.

What is the best way to keep Tuberose bulbs through the winter? I have heard that the bulb that bloomed last summer will not bloom any more. Is that correct, and if so, is the bulb of any account for future use in any way?—W. B. L.

### The Best Chrysanthemums.

Please name best four varieties of Chrysanthemums for pot culture—red, white, pink, yellow; also best time for starting cuttings.—L. S.

### Stored Celery.

Should celery, when stored in trenches, be set on top of the ground in the bottom of the trenches, or should it be heeled in? Is it necessary to cover to shed off the rain, as soon as stored, or will a shower of rain on the celery do no harm? Our celery failed to bleach. The bottom of the trench was, I think, too dry.—L. S.

### Wants the Strawberries to Do Better.

I have been reading diligently what has been said regarding strawberry cultivation, but do not seem to strike on to the points about which I wish to learn. I can buy good plants either potted or otherwise; I can set them out so that they grow, bear fruit, make runners, etc., all right, but I have not as yet got as large berries or as many as I ought to have had. Three years ago I set out some plants and they increased until I have a patch that is about 8x100 feet. This season was its second year. I kept the ground clean, cut off the runners all the fore part of the season, the runners have now been allowed to grow until the whole is a matted bed. Both winters I have put on a good coat of strawy manure, and this spring a little of Swift and Sure bone meal around each plant; but I did not get as good a crop as I did the year before.

Now this bed I intend to root up after next year's crop, but would like to know what is best to do to it for best returns in 1898.

I have the six Henry plants sent in October, but it was a dry time then, but they were watered diligently and all were alive when they were covered; all the original leaves had dried up, but new very small ones grew. Later when it was still dryer, I procured about 50 more plants assorted. I did not dare put these into the ground, so set them each in an 8-inch pot with good potting soil and watered them carefully so as not to drown them or parch them. They have all put out new tops. These plants had not got strong enough to set out when a snow storm set in and the ground froze up. I hustled them into the cellar. Part being placed before the windows and

some below, none in the dark, and they look so far all right.

The cellar will average about 50 degrees. I have known it to be about 81 degrees for a few hours. I intend to set out these plants in the spring to have a part of them fruit just as much and as large as possible, and the other to make as many and as fine runners as possible.

How had I best proceed? What manures had I best apply? The piece of ground that I intend to use is where I, in '97 had potatoes which were cleared early. Mitchell's Potato Mixture was used on them. This ground has been under cultivation for some six years past. I followed with rutabaga, and while they were growing, seeded between the rows crimson clover.—W. S., R. I.

### Short Answers.

(To E. Easterday).—There are two good books on Chrysanthemums; the first is Morton's "Chrysanthemum Culture for America," price \$1 (or in paper, 60c.); the other is an English work by E. Molyneux, "Chrysanthemums and their Culture," (cloth, 50c.). Both to be had at this office.

(To R. W. S.).—Chrysanthemum plants should be not less than nine inches apart in row to get really good results. Running two flowers to a plant 14 inches apart will utilize the space pretty well.

(To J. Vry).—No insects were found on the Rose leaves sent. Kindly forward fresh material packed differently.

(T. W. A.).—The formula for making kerosene emulsion is as given in our Spraying Calendar in the issue for April 17 last, page 276.

### Our Strawberry Pamphlet.

Owing to an expressed desire by the writer to thoroughly revise his series of articles on "Big Berries for All," it may be early in December before we will be able to issue the booklet. It will be well worth waiting for, however, as we confidently anticipate that it will prove the best treatise on the subject ever written, and practical to the core.

### The Henry Strawberry.

Arrangements have been made whereby a bountiful supply of these plants will be ready for spring delivery to subscribers and agents, and in this connection we beg to call the attention of our readers to our generous offer of these plants in another column. We do not think that a more liberal offer has ever been made than the one now advertised, whereby the agent or worker sending us in a club of ten new names, at \$1 each, becomes entitled to 100 Henry Strawberry plants, while five plants will be sent postpaid to each person in his club. This offer will not apply to a club of less than ten. It may be a very long time before such an offer of such a plant can be made again. The wonderful success which has accompanied our premium offer this fall, in the short time at our disposal to advertise it, leads us to believe that the orders for the Henry Strawberry next spring may exceed all anticipations; however, we have planned for a large supply for delivery and trust to be able to meet all demands upon us. Mr. Jerolaman's series of articles is now being placed in pamphlet form, and copies will be mailed free to all who desire to use same in the canvas for new subscriptions.

All the premium Henry Strawberry plants due to date, have been shipped, except where a request has been made to hold them till spring, and judging by the unsolicited acknowledgments received, they are giving immense satisfaction. In order to reduce weight and hinder excessive transpiration some of the leaves are cut off before shipping, this is especially beneficial during a hot spell, and readers can rest assured all is done for the best.

### Our 1898 Art Calendar.

I thank you very kindly for the beautiful Art Calendar which I received yesterday.—MRS. A. B. BROMWELL, Washington.

Received your magnificent Rose and Girl, 1898 six sheet Art Calendar, and it is far beyond my expectations. It is a perfect gem of art, and I for one, am entirely satisfied, and thank you very much for it.—JAMES E. WEIL, Pa.

We consider your 1898 Art Calendar a real beauty, which, together with its marvelous cheapness should give it a place in many homes.—THOS. T. NEWBY & FAMILY, Ind.

Your beautiful Art Calendar received, and I assure you it is much finer than I thought it would be. It is in my opinion the handsomest of its kind this year.—W. P. MARKLE, Mo.

Your beautiful calendar for 1898 was duly received, and has been much admired by all who have examined it. I consider it by far the finest among many that I have received.—JNO. E. CHAPMAN, N. J.

Thanks for your beautiful 1898 Art Calendar. It is fully up to your representations, and its receipt was a pleasure to me and my family. It is an adornment to any home and is the finest Calendar we have ever received.—J. S. BECK, Ia.

I am in receipt of your handsome Calendar for 1898 and consider it one of the most complete and artistic calendars I have ever seen, and all you claim for it. It is a great source of pleasure to myself and family, and we wish your calendar the success it deserves.—WM. SYER, Ont.

I received your Art Calendar for 1898 and it gave me great pleasure as I am a lover of Roses. I think it is grand, and one of the finest I have ever seen.—ROBERT WILLEY, Ia.

I received a few days ago a copy of your 1898 Calendar, and I consider it very handsome and ornamental, and every lover of flowers should obtain a copy.—HENRY H. SAMPSON, Mass.

Your Art Calendar received, and I must say it is truly beautiful, an adornment wherever placed and far superior to anything I have seen of its kind.—CHR. JENSEN, Conn.

I found your Art Calendar which you recently forwarded me to be just as you represented it. It has given pleasure to both me and my family, and I consider it an adornment to any home.—STEPHEN BADDLEY, N. Y.

Art Calendar for 1898 received. Please accept thanks. Am very well pleased with it, consider it a work of art and a superior addition to the already excellent list of calendars.—J. W. WORCESTER, M. D., N. Y.

I am very much pleased with your Art Calendar; it more than comes up to your representation. It is a beautiful piece of work, and I thank you very much for sending it. Others to whom I have shown it agree with me that it is superb.—C. R. HEXT, Ont.

### A Bulletin for the Children.

A recent bulletin of the Ohio Station, "Story of the Lives of a Butterfly and a Moth," was prepared more especially for the young, and as a supplement to "Nature Studies" in the Public Schools. It treats, in a simple, non-technical manner, of the life and development of one of our large, showy colored, and more common butterflies; and of the largest and prettiest of the moths. Teachers, both those in the city as well as those in the country, will be able to secure copies of this bulletin, by addressing the Experiment Station, Wooster, Ohio. The Station, by this means, hopes to reach the coming farmers, while they are yet young, and have more time to devote to securing a knowledge of the things around them than they are likely to have later on in life.

### Strawberry Culture.

#### Concerning Mr. Jerolaman and His Methods.

To the Editor of American Gardening.

I presume that AMERICAN GARDENING is published principally for these two reasons: to instruct its readers as to the best methods of gardening and fruit culture, and to make money. We have all along been led to suppose that the only object to increase the latter was to give means for the enhancement of the former; in the great financial success it has seemed to have had of late in the large increase of its subscription list, this spirit seems to have been fully made manifest. In order to maintain its present high standard and great popularity among the American people, it fully recognizes the necessity of giving to its readers as correct and practical information as possible, and to this end invites the co-operation of its readers. In response to this I write this article; and if it may seem by some of the readers to be couched in rather too plain and sarcastic language, it should be excused on the ground "that the end justifies the means."

When Mr. Jerolaman's series of articles appeared in AMERICAN GARDENING under such a flashing head line as to proclaim him the "New Jersey Strawberry King," it was but natural that all eyes of the fruit growers should be turned toward this new-found king to watch him very closely to see if he were worthy of his throne; and I, as one of the humble subjects of the realm (for on page 667 he fully declares himself king of strawberry growers in the United States), freely admit, looked after him sharply.

I did not find anything very much amiss till I came to his methods of culture where he claims that by setting out plants (layer plants) in the fall for the next spring fruiting, he can grow a first-class crop of strawberries cheaper than any ordinary hoed crop, etc., and further along he says: "It is human nature for a man to think that his method is the best one; such an one I neither intend nor attempt to instruct, but I write this for the benefit of those that have never set out a plant or grown strawberries, and if I can benefit any one, I shall feel proud of it, and consider it as part pay for any trouble that I have taken."

When I came to this I said to myself: "This king needs looking after," for certainly this matter ought not to go before the readers of the AMERICAN GARDENING, apparently indorsed by the editor, without being followed with comment, for if this is the best advice to give to those who never set a plant or grew strawberries, then all my experience and experimenting for the last twelve years have gone for naught, and I am far more ignorant upon the subject than I had supposed (see page 763), and even Mr. Jerolaman has made a great mistake in supposing that my education was about complete. (See further along.) And while, after all my hard striving, my inability to comprehend and profit by the teachings of Nature are to be deplored; how much more lamentable is the fact that at least 99 per cent. of all prominent strawberry growers in the United States, many of them who have

grown strawberries for over a quarter of a century, alive to all the improved methods, and long rated as leading authorities upon the subject, should now be so put in the shade by this new monarch of New Jersey. (See July 24, page 525).

When Mr. Jerolaman, on page 699, wound up kind of short, he gave us to understand that there was some more coming right along in the next issue that would clear up the mystery about his great success by such methods as he described (as I never knew any other person to get paying results from such methods). But after waiting a few weeks, and understanding from an editorial note that Mr. Jerolaman was done for the time being writing for AMERICAN GARDENING, I could not refrain from writing a request to Mr. Jerolaman, through the editor. This was given on November 6, page 768.

Concerning that article Mr. Jerolaman wrote me a letter, from which, feeling that he would have no objection, I take the liberty to quote:

"Dear Sir: I have been requested by the editor of AMERICAN GARDENING to answer your letter to them, having sent a copy of said letter to me which I received to-day. They have also requested that I should write one more article on my method of strawberry culture, which I have consented to do, and in that article answer all your wishes; will make it so plain that any one will understand.

"It is true there are no runners to cut with me. All will be made plain to you. It is also true it cost me less for one acre of strawberries ready to pick, than any acre of any other crop; this I will also make plain.

"I now give you a standing invitation to come out here in June next from June 7 to 14, 1898, and if you do not say that I have only stated truth and nothing but the truth (after seeing how little I spend in growing the largest crop of strawberries any one ever saw), I will take good care of you and pay all your expenses from Maine and back to your home. I, like you and many other growers, used to nurse strawberries, but that was done with me ten years ago or more, and I honestly believe that I have learned all that it is possible to know about strawberries, and I also, as I have heard of you before this, believe your education is about completed, and it is only imagination on your part to think otherwise."

Now I would like to ask all the readers of this paper, if from this letter from which the above quotations were taken, and from what Mr. Jerolaman says about keeping his word good, etc., in the second paragraph on page 688, I should not have expected to have seen a reply different from that which was given on page 811. If what he says in that article, following where he mentions my name, is making it so plain that any one will understand his methods of strawberry culture, then I must confess that I know even less about English diction than about strawberry culture. If Mr. Jerolaman cannot keep his word better than that, and offers no excuses or apologies for so doing, how can we place confidence in anything he may tell us? However, he may yet make this all plain to us as well as the other matter; so let us hold on to this forlorn hope a while longer.

While we are waiting for this pamphlet to come forth, I will just say a word to the beginners of strawberry growing: Go slow about setting layer plants in the fall, most especially where the ground

is liable to freeze six inches or more deep during the winter months; for if you do not you will be likely to find rocks ahead. of which I fear Mr. Jerolaman will not tell. I have had much experience in setting plants, both potted and layered, in all the months from April to December, and under all conditions which would be likely to exist in this locality; and have found from the middle of September to the last of October by far the most dangerous time of all to set out plants. I have also experimented largely to find out the most economical way to use manures on the strawberry patch, both barnyard and chemical, and will at some future time give results through the columns of AMERICAN GARDENING or elsewhere.

E. W. WOOSTER, Me.

### Violet Diseases.

The Floricultural Society of New Jersey, at its meeting held in Orange, N. J., on Monday evening last, discussed the subject of disease of the Violet. The lecturer of the evening was Dr. Dodge, who in a most interesting and instructive manner detailed his method of making cultures of the common disease known as spot. By means of diagrams he showed the action of the pest on the epidermis of the leaf. His deductions from the results obtained in his cultures were to the effect that the growth of the disease corresponded closely to the descriptions of that of a fungus. It was not a bacterial growth, such as produced trouble in the human anatomy. The fungus was one, which, under different circumstances had different forms of growth. Dr. Dodge at the outset of his brief talk, intimated that the Violet spot was the only disease of this plant to which he had given any study.

Dr. Halsted, of the New Jersey Experiment Station, on being called upon, briefly described other diseases to which the Violet is heir, among them the bacterial disease that strikes in at the crown of the plant and tears down the tissue of the leaf. Another, a leaf spot, different from that described by the lecturer, coming from another kind of spore, its thread-like ramifications running in between the cells of the plant. The spores of this disease are carried by dripping water or the movements of the air. Another, the cercospora, or Violet leaf disease, enters the leaf by the stomata or breathing pores, branching and breaking down the tissues. Black spot, different from the pest of the same name affecting the Rose, only attacks the Violet when the plants are not kept up to "the high-water mark." One of the worst troubles below ground from which the Violet suffers is the root gall, caused by nematodes or eel-worms.

Chairman McRorie then called upon several members to take part in the discussion, which resulted in hosts of contradictory testimony as to the cause, effect, and remedy. It was advanced that a moist atmosphere was conducive to the development and spread of the disease. Its effects were most remarkable. Sometimes plants that up to a certain stage had been free would be seized suddenly, the old leaves being attacked and the younger growths enjoying immunity from the pest's ravages; again young

and old leaves would both suffer. Russian Violets as well as the less hardy Marie Louise and others of that type, were all liable to be more or less affected. It was suggested that not to wet the foliage might prove a preventive to the spread of the disease, to a more or less degree; while, from the experience of one successful grower who fed his soil liberally and mulched heavily, a good soaking with the hose had been the remedy applied to get rid of the trouble. Location, style of house, and other points were all touched upon. Mr. Herrington mentioned a case where Violets were raised most successfully at Highlands, New York State, in houses originally built for Rose growing, under conditions that were supposed to be dead against successful Violet growing. The plants were in steam-heated houses, on elevated benches. The houses were 200x23 feet. The soil in the benches was kept rather dry so as to have the plants dry at the roots. Practically no water was applied to the roots. The plants are only naturally fed, and a good spraying given every other day; and there was not a trace of spot on the place. Curiously enough, plants obtained from this place and grown in another locality, developed the disease. Mr. Manda believed the degeneration seen in the Violet was attributable to forcing and over-propagation. The stock might be restored to prime condition, if a certain portion were put in cold frames and left there when the plants were making their natural growth and then propagated from. The Violet, like the Carnation and Chrysanthemum, was more or less a hardy plant, and to force it, from year to year, like a tropical plant, weakened its constitution and opened up a way for these diseases to get in their work.

The discussion, as summarized by Dr. Kitchen, brought out the following points: That specific organisms are the primary cause of the diseases; that it pays to obtain healthy plants with vitality to ward off these diseases; that high altitudes, where the atmosphere was bright and clear, were favorable to successful Violet growing; that a certain amount of shading is beneficial, obstructing the burning action of the sun.

In answer to a question, Dr. Halsted said that preparatory to filling the houses, fumigating them with sulphur would act as a preventive; spraying diseased foliage with Bordeaux mixture and lime, and dusting with sulphur would check the disease, and although it had never been demonstrated, hydrocyanic acid gas might prove to be destructive to the lower organisms constituting the different diseases.

After all the vagaries of these troublesome pests had been deliberated upon, it was found that nothing of a novel character as to their origin and cure had been elucidated, when the meeting adjourned.

An Irish gardener once applied for a situation to Mrs. Lopitz in Irvington.

"Well, Mike," she says, "every man has his own bed to see to in the garden."

"Well, hold on," says Mike, "I swarn when I loft the sod be gob's I'd never slape outside."—COMMUNICATED.

The five Henry strawberry plants arrived in the best possible condition. They were very strong, and we expect to see quite a quantity of fruit on each of them next June.—H. & M., Colorado.

## There is Not a Home in the Land

But calls for a yearly Calendar.

Every family tries to get one or more; generally more.

## There are Calendars and Calendars

Some are good, some bad, most of them indifferent.

## There Will Not be a Calendar Issued for 1898

To exceed in artistic elegance, finish, beauty of designs and effective coloring, the one we to-day offer as a premium to every subscription to AMERICAN GARDENING received before December 31, 1897.

# EVERY SUBSCRIBER IS ENTITLED TO ONE

AND CAN EASILY EARN TWENTY.

OUR magnificent **Rose and Girl 1898** six sheet **Art Calendar**, two months to a sheet, each sheet  $8\frac{1}{2} \times 11\frac{1}{4}$  inches, is superbly lithographed in eleven colors, and printed on hammered paper; the whole tastefully tied with silk bow—undoubtedly a work of art fit for the most elegant home, and as handsome a Calendar as was ever published. Each one of the six designs presents a distinct type of female loveliness and a fresh study in roses, the coloring on each sheet being rendered in harmony with the design. There is not a line of advertising on the Calendars to detract from their value. They will not be sold by us for less than \$1.00 each

### Who is Entitled to a Calendar?

**EVERY SUBSCRIBER** renewing before **December 31, 1897**, enclosing Five Cents additional to pay packing and postage.

**EVERY NEW SUBSCRIPTION**—To induce people to test the value of AMERICAN GARDENING we will send the Calendar absolutely free to every name received direct not previously on our mailing list. Remit \$1.00 for A. G. 12 months.

**EVERY ONE** sending us a club of Four 3-month trial subscriptions at twenty-five cents each, will get a Calendar, free as a premium, by return mail.

**EVERY NEW name sent in by an agent.**

NOTE.—We have ordered manufactured for us a large stock of these superb Calendars in the endeavor to have sufficient supply for all demands, but will not guarantee to fill orders after supply is exhausted. Therefore, order yours now.

**Special to Agents** A copy of our Art Calendar to show people will clinch the argument and obtain the subscription. Bona fide Agents will be mailed one copy, securely wrapped, on receipt of only Twenty-five cents (one-fourth its value.) Armed with this superb Calendar we misjudge human nature greatly if any ordinary mortal cannot secure a big list of new subscriptions every day. Every new subscriber you send us gets a Calendar by return mail.

### We Pay Agents

Every new subscription at \$1.00 entitles the agent to **Five of the Wonderful Henry Strawberry Plants**, to be delivered next Spring. Thus 100 new subscriptions would secure agents 500 plants; a possession worthy of your consideration. Every new subscriber taken by agent will receive one of our Art Calendars free by return mail.

Agents who do not want the Henry Strawberry Plants can retain as their payment **20 cents in cash** on each subscription they take, or will be credited **twenty-five cents** on any book, magazine or publication they wish to obtain through us.

REMIT BY P. O. or EXPRESS MONEY ORDER—IT IS SAFEST.

## PRIVATE GARDENERS.

### Appointments and Doings.

Gardeners and others knowing of recent appointments and movings are requested to forward particulars of the same for publication in this column. No charge is made.

#### Poughkeepsie, N. Y.

The Dutchess County Horticultural Society held a meeting on Wednesday, December 1, when officers were nominated for the ensuing year as follows: President, Mr. George Saltford; vice-president, Mr. Herman Asher, Mr. Harold Cottam; secretary, Mr. Harold Cottam, Mr. John C. Galvin, Mr. Arthur A. Loughren; assistant secretary, Mr. William G. Saltford; treasurer, Mr. James Sloan. The election is on January 5.

It was decided to hold a banquet on Wednesday, January 5, 1898, also that the New York Gardeners' Society and the New York Florists' Club be invited to attend. A committee to arrange the dinner is: Messrs. Wm. Saltford, William Schickel, Charles Mitchell, James Blair, and Frederick Gilman.

Six new members were elected: Mr. R. J. Barry, Saugerties, N. Y.; James Bell, Hyde Park, N. Y.; C. F. Bahret, Poughkeepsie; Arthur Saltford, Poughkeepsie; Captain Haubenesthe, Poughkeepsie; Charles Weatherhead, New York.

Mr. William Turner, of Tarrytown, read a paper on "Peaches and Nectarines Grown Under Glass," which is being published elsewhere in our columns.

#### Syracuse, N. Y.

I learn that Nathan Smith & Son's grand yellow seedling No. 189 scored before the Boston committee 92 points commercial and 94 exhibition, and they have named it Thornden after Major Alex. Davis' place in Syracuse. Major Davis was the first president of the Central New York Horticultural Society, and his place on University Heights is one of the finest in the state. The greenhouses contain many beautiful and rare varieties of stove plants and many rare orchids, etc. Mr. Campbell, the manager of the place, and secretary of Central New York Horticultural Society, is one of our foremost growers as well as a genial and whole-souled gentleman who has a host of friends. There will certainly be some big money prizes offered for this variety at our show next fall and also for Mr. Grove Rawson's Yellow Fellow.—C. A. PHILLIPS.

#### New Jersey Floricultural Society.

This association, at its regular meeting held on Monday night, elected the following officers: Malcolm McRorie, president; John Hayes, vice-president; Peter Duff, secretary; George Smith, treasurer. This is a re-election of last year's officers. It was decided to hold the annual dinner at the time of installation, which will be the regular meeting in January.

#### New York.

The winter session of the American Institute Farmers' Club opens on Tuesday, December 14, and as heretofore meetings will be held the second Tuesday in each month at 2 P. M., at 111 West Thirty-eighth street. The Horticultural section

will meet at 7:30 P. M., on the same day as the Farmers' Club. This new section promises to be one of the leading features in a hort-floricultural sense. It is expected that an instructive course of lectures will be delivered during the winter. The meeting next Tuesday evening will be the first regular meeting of the section. The future course of the section will be discussed and a program beginning in January and ending in June arranged for. A course of lectures on Botany is suggested.

All meetings are open and membership to either section free.

#### Cycads and Palms.

To the Editor of American Gardening.

With reference to a communication under the above heading, from Gustave X. Amrhyn, superintendent to James W. Quintard, which appeared in your issue of the 27th ult., I would like to ask Mr. Amrhyn, seeing that he has such profound botanical knowledge, if a Zamia is a Cycas? At the show in question (Port Chester, N. Y.), the schedule called distinctly for "best Cycas" and not for a plant of any kind whatever of the order Cycadaceae as Mr. Amrhyn would have it appear in his statement of the case.—R. W.

#### Orchids at Philadelphia Show.

I notice in your issue of November 20, that you doubt whether "such a unique and valuable collection of orchids" has ever been exhibited in any American floral show as that of Mr. Roebling's at the recent New York show. I therefore enclose you the list of orchids exhibited by me at the Philadelphia flower show. It is a small part of the most noted collection in America, and is as well known in Europe as it is here; it is the collection of the late Mr. Erastus Corning, and I am surprised that your paper has not even given it a passing notice.—ALPHONSE PERICAT, gardener to Mrs. Geo. B. Wilson, Philadelphia.

[We much regret that any important feature of the recent exhibition at Philadelphia should have been omitted from our notes. The list of orchids shown in the collection of our correspondent is a most comprehensive one, and contains the names of many varieties. Yet for all that we do not see any reason to modify our expression of opinion upon the New York display; both exhibitors deserve full credit for what they have done.—Ed.]

#### Newport, R. I.

A tank 68x22 has just been completed on the Mrs. H. M. Brooks estate, principally for Nelumbiums. Mr. James Hill, the gardener, is most successful with this class of plants.

At the Breakers greenhouses, at the present time Begonias make a fine show, B. socotrana is extra well done; one of the most valuable characteristics of this species is the lasting quality of the blooms, and having long stems, they are also excellent for cutting. B. semperflorens gigantea rosea is also grown in quantity and is useful both as a pot plant and for cutting from.

One bench is occupied with an improved form of B. incarnata; has smaller foliage and the flowers are of a lighter

shade than the last named. Mr. Laurie, the gardener, and Mr. Pow, his foreman, take especial interest in this class of plants.

For summer bedding, large quantities of Begonia Erfordii and the improved forms of B. Vernon are being propagated. But of this class I have seen nothing to equal those raised by Mr. Arthur Griffen of this city, and for which he was awarded a silver medal by the Newport Horticultural Society on November 10, the improvement noted being in the extra size of the blooms and the purity of the colors; these are of the semperflorens type, consequently are dwarf. Gardenias are now being propagated in quantity for next summer's work.

### Chrysanthemum Society of America.

#### Secretary's Official Report.

Since last report, seedlings have been examined and reported as follows:

CHICAGO, November 20, 1897.

**Mrs. C. H. Peirce**, exhibited by F. Dorner & Sons Co.; La Fayette, Ind.; Japanese, deep yellow, scored, commercial scale, 90 points.

**Stelletta**, exhibited by Nathan Smith & Son, Adrian, Mich.; Japanese reflexed, yellow, scored, commercial scale, 83 points.

**Rustique**, by same exhibitors; Japanese incurved, light bronze, scored, commercial scale, 85 points.

**Merza**, by same exhibitors; Japanese incurved, white, scored, commercial scale, 85 points.

**Madison**, exhibited by E. G. Hill & Co., Richmond, Ind.; Japanese incurved, bronze, scored, commercial scale, 79 points.

November 27.

**Wm. H. Chadwick**, exhibited by Grove P. Rawson, Elmira, N. Y.; Japanese incurved, bluish white, scored, commercial scale, 93 points.

**Mr. W. B. Brown**, exhibited by Theo. Bock, Hamilton, O.; incurved, white, scored, commercial scale, 78 points.

BOSTON, November 20.

**Arline**, exhibited by Nathan Smith & Son, Adrian, Mich.; incurved, white, scored, commercial scale, 87 points; exhibition scale, 90 points.

**Thornden**, by same exhibitors; Japanese, deep chrome-yellow, scored, commercial scale, 92 points; exhibition scale, 94 points.

**Mrs. C. H. Peirce**, exhibited by F. Dorner & Sons Co.; Japanese, bright yellow, scored, commercial scale, 91 points.

November 27.

**Wm. H. Chadwick**, exhibited by G. P. Rawson; Japanese incurved, white, scored, commercial scale, 92 points; exhibition scale, 98 points.

PHILADELPHIA, November 20.

**Spottswood**, exhibited by Robert G. Carey, Chestnut Hill, Pa.; incurved, light yellow, scored, commercial scale, 91 points; exhibition scale, 88 points.

**Minnewaska**, exhibited by John N. May, Summit, N. J.; Japanese pink, scored, commercial scale, 81 points; exhibition scale, 77 points.

**Dolores**, by same exhibitor; scored, commercial scale, 84 points; exhibition scale, 83 points.

**Mrs. C. H. Peirce**, exhibited by Fred. Dorner & Sons Co., La Fayette, Ind.; incurved, yellow, scored, commercial scale, 90 points; exhibition scale, 87 points.

November 27.

**W. H. Chadwick**, exhibited by Grove P. Rawson, Elmira, N. Y.; Japanese incurved, bluish white, scored, commercial scale, 89 points; exhibition scale, 89 points.

**Sport from Mrs. Jerome Jones**, exhibited by Ferdinand Heck, Reading Pa.; Japanese incurved, light yellow, scored, commercial scale, 90 points; exhibition scale, 90 points.

**Our Old Friend**, exhibited by W. K. Harris, Philadelphia, Pa.; Japanese incurved, canary-yellow, scored, commercial scale, 89 points; exhibition scale, 88 points.

NEW YORK, November 27.

**Wm. H. Chadwick**, exhibited by Grove P. Rawson, Elmira, N. Y.; Japanese incurved, bluish white, scored, commercial scale, 86 points.

CINCINNATI, November 20.

**Arline**, exhibited by Nathan Smith & Son, Adrian, Mich.; incurved, white, scored, commercial scale, 84 points.

**Rustique**, by same exhibitors; Japanese incurved, bronzy yellow, scored, commercial scale, 73 points.

**Mrs. C. H. Peirce**, exhibited by F. Dorner & Sons Co.; Japanese reflexed, yellow, scored, commercial scale, 87 points.

**No. 169**, exhibited by E. G. Hill & Co., Richmond, Ind.; Japanese incurved, white, scored, commercial scale, 81 points.

**Mrs. Wm. B. Brown**, exhibited by Theo. Bock, Hamilton, O.; Japanese incurved, white, scored, commercial scale, 84 points.

NOTE.—Stelletta was exhibited as Kilo, and the change was made to avoid a clash with Clio, exhibited this season.

Thornden was shown as Golden Gem; the change made was necessary, as the latter name has been applied already to a chrysanthemum. In last report No. 111 (Bessie Hollis), shown at Chicago, should have read 83 instead of 87 points.

ELMER D. SMITH, Sec'y.

### How's This!

We offer One Hundred Dollars reward for any case of Catarrh that cannot be cured by Hall's Catarrh Cure.

F. J. CHENEY & CO., Toledo, O.

We, the undersigned, have known F. J. Cheney for the last 15 years, and believe him perfectly honorable in all business transactions and financially able to carry out any obligations made by their firm.

STRAWBERRY plants, 25c. each, of Clyde, Glen Mary, Wm. Belt and Blenmark, sent prepaid for one dollar. Catalogue free. Enos W. Dunham, Stevensville, Mich.

DIRECT from the grower, duty free. Hulsebosch Brothers' Seed, Bulb, and Plant Catalogue is now out, prices very reasonable, anybody who has not received a copy should address Hulsebosch Bros., Englewood, N. J.

DO YOU WANT the best flower pots? If so, send address to The Whilldin Pottery Co., 712 Wharton St., Philadelphia. Three shipping points, can save you freight.

### WANTED.

[Rates, etc., same as in "For Sale" column.]

ASSISTANT gardener.—A young, sober, practical man can get permanent position at once. State wages with board. R. B. Hayes, Gardener and Florist, Shelby, Ohio.

## A Poultry Encyclopedia.

THE POULTRY KEEPER, edited by P. H. Jacobs, one of the best informed men of the age on poultry subjects, and who is aptly termed a walking poultry dictionary, has published four large pamphlets, covering every subject connected with the feathered tribe, which it entitles ILLUSTRATORS Nos. 1, 2, 3, and 4. The series constitute a veritable "POULTRY ENCYCLOPEDIA," covering the ground so completely that by the aid of the "Four Illustrators," and the regular monthly visits of the "POULTRY KEEPER," the reader can glean all the information necessary to become a successful poultry raiser.

You could not get any similar series in the whole world, even for \$50 each, for they do not exist. Were they given in regular book form with elaborate binding and colored cuts you would think them easily worth \$5 each, but what is wanted is not elegant printing, so much as valuable information that you can make use of. They have cost much in labor and cash, but we offer the set for almost nothing. A partial list of the subjects treated is as follows:

ILLUSTRATOR No. 1.—Poultry Houses, Incubators, Brooders, Coops, etc. 25 cents.

ILLUSTRATOR No. 2.—Artificial Incubation, Raising Chicks, Testing Eggs, etc. 25 cents.

ILLUSTRATOR No. 3.—Poultry Diseases, Lice, Gapes, Moulting, Egg Eating, etc. 25 cents.

ILLUSTRATOR No. 4.—Judging Fowls, Description of Breeds, Mating, etc. 25 cents.

**\$1.50 Buys All This: \$1.50**

For \$1.50 we will send American Gardening, (weekly) one year, The Poultry Keeper (monthly) one year, and the Four Illustrators, as above.

ORDER NOW.

AMERICAN GARDENING, P. O. Box New York.

## The Bee Keeper.

### Who Should Keep Bees?

The fruit growers first of all should give this matter their attention. Did you ever think of the amount of nectar that is wasted every year in the strawberry field, the raspberry plantation, or apple, peach, and pear orchard? Indeed, it is worse than wasted, as the bees perform a very important office while they gather the nectar, viz., fertilizing and cross-fertilizing the flowers, and the result is a larger crop of better fruit.

I am quite sure that it will pay a fruit grower to keep a score or so of colonies just for the work the bees do on the blossoms. Of course, where a locality is well stocked, this would not count, but I often see large territories devoted to fruit with very few bees indeed. There is not the least doubt but in such localities there would be a noticeable difference of productiveness if a few apiaries were established.

Mr. A. I. Root mentions a case where by injunction the beekeepers were compelled to remove all their bees from a certain fruit locality as the fruit growers claimed the bees ruined their fruit. When the bees were gone the trees would not set, though they would blossom ever so abundantly. Sometime afterward the fruit growers learned their lesson and invited the beekeeper to bring back the bees and soon the abundance of fruit showed plainly that the bee is of infinite value to the fruit grower. Sir John Lubbock, in his "Fruits, Leaves, and Flowers" and "Ants, Bees, and Wasps," gives some very apt illustrations of this law.

### The Suburbanite.

The suburban resident who does professional work in the city, generally of a sedentary nature, will find amateur bee culture a most delightful exercise and quite a fascinating study. The careful observation and study of the habits of these orderly, intelligent and self-sacrificing little insects not only give one pleasure, but appeal to the better side of one's nature and so encourage virtues that few other avocations do.

### Invalids.

To invalids, it is not a cure-all, as are the electric appliances and patent medicines, but it works wonders. Just now I recall a case of a neighbor of mine whose health was all broken up and whose eyesight was so bad that the doctor thought there was no hope.

He purchased a small home and started beekeeping on a small scale and in five years was a well man with a pair of good eyes and a purse so well filled that he purchased a large farm. I could cite scores of instances just as remarkable.

The work entailed is as exhilarating as a summer of exercise in the Alps and not half as dangerous! The exercise is invaluable while the profits are valuable.

### Who Can't Keep Bees

There are very few people who cannot keep bees and those few are the shiftless, lazy, indolent, and careless who fail in other vocations. The general requisites are promptitude, persistence, careful planning, and energetic execution.

## The Window Garden.

New Geraniums in New Color Combinations.

Inquiries received indicate considerable interest in certain of these described in the issue of September 25. We are sorry not to be able to refer inquirers to any firm selling all the varieties mentioned. The only firm known to us which offered them all has gone out of existence since the former note was written. The firm of Storrs & Harrison Co. and also the Cottage Gardens (C. W. Ward), are large handlers of Geraniums for the retail trade, and would be likely to have most of the sorts desired.

**Freedom from Insects.**

During no season do we remember to have experienced greater freedom from insect pests up to Thanksgiving than during the present. This is attributable to the fact that all plants known to be pleasing to aphids, etc., were sprayed with tobacco tea before the foe appeared. With this precaution, there has been no need of continual fighting, as none of the foe have been in evidence. Not even Roses and Carnations have been infested.

**Rubber Bulb Sprinklers.**

The word "bulb" as used above, refers to the little tool, and not to any plant. There are several makes of these handy sprinklers, and they are an exceeding comfort to any plant raiser who is not strong enough to handle the pots often. Nor is the saving of strength more than a beginning of merit. The spray is very fine, and more effectual than much of the ordinary sprinkling over a sink. The plants receive the attention oftener, when it is easy to give it, and show, almost at once, decided improvement. It is by no means economical.

cal, however, to buy the cheaper sprinkler, the one without the angle neck, as such will not throw the spray from below, where one desires most to be able to get it.

**Cobaea in the Window.**

*Cobaea macrostemma*, mentioned lately as budding in the window, from seed summer-sown there, is now in full bloom. It is not showy enough, however, to count for much more than its pretty vinery. The blossom colors are almost exactly those of the admired *Cypripedium*, dull brown, combined with pale green. The red stamens, which were supposed to give a fair amount of color to the general effect, are, in these house-grown plants, so pale and dull as to be scarcely noticeable; certainly, not charming.

**Easy Work Among the Plants.**

The aid to be had from a good, fine sprayer has been noted. The use of moss as a bed for the house bulbs, as advised in a recent issue of *AMERICAN GARDENING*, is a relief in the direction of weight not appreciated fully until tried; while the new fibre potting stuff, Jadoo, has enough to recommend it on this score, if it had no other merit to its account. We find that the delicate Little Gem Callas and stunted Primulas potted in it are already looking up; and we certainly hope that it will prove all that is so freely claimed, and, in some quarters, so freely accorded.

**Early Narcissal.**

Double Roman Narcissal, placed in water October 21, are now, 38 days later, just ready to bloom. Others of the same lot, potted in earth, are about two weeks behind the first-named. All have been grown without fire heat except such as is furnished by a chimney passing through the plant room. Nor have they had but the briefest sunshine at any time.

**The Epiphyllums.**

It is at this time of the year that the plant lover is almost ready to affirm that there is, after all, nothing more satisfactory than these smaller Cacti, so easily amenable to ordinary culture. How gorgeous they are, and how delightfully their brilliant blooms droop over the brackets!

**Cypripedium Insigne.**

Doubtless most people would be shocked if an expert should say to them that Orchids were no more difficult to grow than Geraniums! For has not the Geranium been for unnumbered years a synonym for ease of culture? Still, some Orchid growers are making just this statement, and if there is one Orchid which, more than another, will bear it out, doubtless it is *Cypripedium Insigne*. Free flowering and vigorous, it may be a long time in bloom with no great amount of effort or worry. It is not particular as to soil. It may be potted exactly like an ordinary greenhouse plant, and will do about as well as if in peat and moss *a la* Orchid. It needs plenty of water, and shade from the most fervid sunshine. Re-potting is best done just after the flowering period. The neutral colorings of most of the *Cypripedium* do not appeal to the great mass of the people. They see in them nothing to rave over. It is, therefore, best always to see the plant in bloom before buying, if unfamiliar with them.

## The Poultry Yard.

### The White Wonder.

At the present time, perhaps there is no other breed exciting so much interest in many quarters, as the one named in our title-head. Certainly this is true if we limit our consideration to the breeds fairly well-known, but not yet admitted to the Standard of Perfection.

The lovers of this breed have been up in arms for some time past, because they feel that they have been hardly treated by the preliminary committee which lately met to consider Standard revision. This revision, which now takes place every five years, offers the desired opportunity for the newer breeds to apply for admission, that they may be placed on a fair footing with other breeds.

At the meeting referred to, it is said that the petition for the desired admission of the White Wonder was the longest ever presented for a new breed. Yet the committee, nominally on account of the resemblance between the White Wonder and the White Wyandotte, refused to recommend the admission of the former.

The two strongly opposing ideas which rule the decisions on new breeds are these: *a*, it is the part of good sense to admit no new breed which so strongly resembles any breed already standard as to be likely to injure the older breed; *b*, it is the part of wise foresight to admit any new candidate that can furnish indisputable evidence that it now breeds true and is therefore entitled both to be called thoroughbred, and to be described by the leading authority on thorough-breeds.

As the matter now stands, the literature which we are obliged to consult for our ideas concerning the breed, comes from its own club or from its individual admirers, and not from a source both authoritative and unbiased. It is this which must hamper the breed; it is this which must be kept in mind in reading what is said of it, wherever we find it described.

It is now, I think, getting on toward eight years since public notice was given of the formation of this new breed. In April, 1891, a leading poultry monthly spoke of it as the very newest thing in the line of new breeds. It was a Vermont output, supposed to be a combination of the best qualities of the White Wyandotte and the Light Brahma. The weight is between the two and were it not for the feathered legs, there is little doubt that the breed would have a tendency to push the White Wyandotte "off the earth." And it is quite evident that the Wyandotte breeders are afraid of so similar a rival with such a taking name.

As a matter of course, everything is claimed for the breed. Few breeds, indeed, have missed this experience. One lover of this breed claims 432 eggs in January, from twenty June-hatched pullets. Also, that in three years, he never lost a fowl, or—more wonderful—a chick, of this breed, while raising them by many scores during some seasons.

They are claimed to be expressly valuable as a farm and market fowl. Seven to nine-pound hens must certainly be very nice to sell when the moult makes this necessary. For market, or the table

a big carcass takes the attention at once. But it must not be forgotten that a big hen takes more space than a little one in yard and house.

One enthusiast speaks of the White Wonder as an economical bird, not too greedy, not too broody, and liberal as to egg production. Indeed, the claim all around is that the bird is an extra layer. Those who want more good qualities in a single breed, must of course, look further. They may fare worse the while.

# The Henry Strawberry!

**To Meet** The extraordinary demand for this unequalled Strawberry we are preparing 100,000 Henry plants for delivery through next Spring to

## Premium Earners

Henry Strawberry Plants can be obtained solely through a subscription to **AMERICAN GARDENING**; as the publishers will not sell plants under any consideration;

Neither will Mr. Jerolaman who has signed a contract with us to that effect.

## Who is Entitled to Plants

### NEW SUBS. AND RENEWALS

Five plants of the Henry will be mailed, postpaid, as a premium to every Renewal or New Subscriber sending us \$1.00 for a year's subscription. When remitting be sure to state if you want this premium.

### TO AGENTS AND WORKERS

For every \$1.00 received from agents and present subscribers for New Subscriptions, we mail, postpaid, Ten Henry plants, Five to the New Subscriber and Five to the Agent.

## Special to Club Raisers!

### CLUBS OF TEN

To every agent sending us in a club of Ten New Names and \$10.00 we will forward in payment therefor One Hundred (100) Henry Strawberry Plants, by express, as well as send Five plants, postpaid, to each person in the club.

All orders are now held for Spring Delivery.....

The series of articles on "Big Berries for All," written by Mr. H. Jerolaman for **AMERICAN GARDENING**, with additions, will soon be in pamphlet form; and agents and friends will be supplied with copies on receipt of stamp. It will be the most unique pamphlet on the Strawberry ever issued.

## MEEHAN'S MONTHLY

**Of Interest** not only to the amateur gardener, the botanist and the scientist, but also to every lover of horticulture and nature. The name alone is sufficient guarantee of the high standard of this horticultural magazine, its editor, Thomas Meehan, formerly having edited the famous "Flowers and Ferns of the U. S.," and the well and favorably known "Gardener's Monthly." The concise, instructive, and practical articles made it popular from the first, and few of its class have been so universally well received and so widely quoted.

**The Leading Feature** the colored plate of some native flower or fern, executed in Prang's finest style, and the chapter relating thereto, is by itself well worth the subscription price. Two dollars a year. Sample free.

## DO YOU NEED WATCHING?

Or, to put it another way,

## Do You Need a Watch?

We sell them, sell them at such an exceedingly low price that you can't afford to go watchless. Got 'em all sizes and styles. But we'll just mention two:  
An Eagle or Waltham Watch, best movement made, hunting case, accurate time-keeper, handsomely engraved, Dueser Case, heavily gold-plated—last for all time. Ladies' or gentleman's size.

We'll send it to your address with privilege of examination. If it's not entirely as represented, send it back—costs you nothing. If you like it, pay the agent express charges and \$5.50. That's fair. Or this—

A Hunting Case Watch—beautifully engraved case, first-class movement, any size, heavily plated (14k)—looks just like a \$60.00 gold watch—keeps as good time as any of them. Sent to your express agent with privilege of examination—same conditions as all our watches sent out—and if you like it, pay him \$5.45 and express charges.

If you take our word for it, and send money with order, a handsome chain goes with either, and express charges are paid by us, for the prices named above.

## WHOLESALE MARKET REPORT.

## New York.

The cut flower business is again moving slowly. The supply is light but there is little demand. Outside prices are only maintained upon a very limited quantity of high-grade stock. Bride, Bridesmaid, and Meteor Roses vary from 75c. to \$1.50 for culls and seconds. No. 1, \$3 to \$5 per 100, extras and specials, \$8 to \$12. American Beauty fails to realize more than \$4 per dozen for top grade.

Violets are moving slowly at 75c. to \$1.50 per 100, although shipments are light.

Carnations realize \$1.50 to \$2.25 per 100 for regular stock. Fancy and novelties make from \$3 to \$5 per 100. Flora Hill and Victor are classed with these. Valley maintains its price at \$3 and \$4 per 100.

Business is good in fruits and vegetables and the market clears well. Fancy and hothouse stock is in lightest demand of all at the present.

Hothouse Gros Colmar grapes, (English) make \$1 to \$1.25 per pound. American grown are hard to move at 60c.

Tomatoes are meeting stiffer competition from the South and move slowly at 20c. to 25c. per pound.

Cucumbers make 50c. to 75c. per dozen.

Lettuce is falling off in quality, prices vary from 40c. to 60c. per dozen for fancy. Lower grades \$1 to \$2 per barrel.

Radish \$2 to \$3 per 100 bunches. Mushrooms are increasing in quantity and 40c. to 60c. are outside quotations.

Apples—Wine Sap, Va., poor to fair, \$2 @2.50; good to fancy, \$3 @4; Johnson's Winter, Va., poor to fair, \$2 @2.50; good to fancy, \$3 @4; King, State, poor to fair, \$2 @2.50; good to fancy, \$3 @4; Ben Davis, western, poor to fair, \$2 @2.25; good to fancy, \$2.50 @3.25; Greening, State, poor to fair, \$1.75 @2.25; good to fancy, \$2.50 @3.50; Baldwin, state, poor to fair, \$1.75 @2.25; good to fancy, \$2.50 @3.25; N. Spy, State, poor to fair, \$1.75 @2.25; good to fancy, \$2.50 @4; mixed lots, poor to fair, \$1.50 @2; good to fancy, \$2.25 @3.

Pears—Beurré Bosc, per barrel, \$2 @3; Lawrence, per barrel, \$1.50 @2.25; Beurré Clairgeau, per barrel, \$2 @2.50; Beurré d'Anjou, per barrel, \$1.75 @2.50; Vicar, per barrel, \$1.25 @1.75.

Grapes—Catawba, fancy, per small basket, 9 @11c.; ordinary, per small basket, 7 @8c.; Concord, fancy, per small basket, 8 @9c.; ordinary, per small basket, 7 @7½c.; white kinds, in trays, per 100 pounds, \$1 @1.25; Catawba and Concord, in trays, per 100 pounds, \$1 @1.25; very inferior, per 100 pounds, \$1 @75c.

Peanuts are in liberal supply and quiet, with most sales at \$1.25 per bushel of 50 pounds; some ordinary go at \$1. Bull nuts dull at 50 @75c.

Brussels sprouts—Per quart, 5 @8c.

Cauliflowers—Choice to fancy, per barrel, \$2.50 @4; fair to prime, per barrel, \$1.50 @2; culls, per barrel, \$1.

Celery—Choice to fancy, large, per dozen, 25c.; fair to prime, per dozen, 15 @20c.; small, per dozen, 8 @12c.

Cabbages—Jersey and Long Island, per 100, \$3 @3.50; State, per 100, \$2.50 @3.

Cucumbers—Florida, per crate, \$1 @1.75.

Egg plants—Florida, per barrel, \$5 @6.

Florida, per box, \$2.50 @3.

Kale—Norfolk, per barrel, 50c.

Lettuce—New Orleans, per barrel, \$3 @3.50; Florida, per basket, \$1.50 @3.

Onions—Orange Co., red, prime, per bag, \$1.75 @2.25; Orange Co., yellow, per bag, \$1.50 @2; Orange Co., white, per bag, \$1.50 @3.50; Orange Co., inferior, per bag, \$1 @1.25; State and western yellow, flat hoops, \$1.25 @1.75.

State and western, yellow, bulk, per barrel, \$1.75 @2; eastern, white, per barrel, \$2.50 @5; eastern, red, per barrel, \$2.25 @2.75; eastern, yellow, per barrel, \$2 @2.25.

Peppers—Florida, per carrier, \$1.50 @2.50.

Radishes—Norfolk, per 100 bunches, \$1.

String beans—Charleston, choice, per bushel basket, \$1.75 @2.25; Charleston, common, per bushel basket, \$1 @1.25.

Florida, round, wax, per basket, \$1.50 @2.25; Florida, round, wax, per crate, \$1.50 @2; Florida, flat wax, per basket, \$1 @1.75; Florida, flat wax, per crate, \$1 @1.50; Florida, green, per basket, \$1 @2; Florida, green, per crate, \$1 @1.75.

Spinach—Norfolk, per barrel, \$1.75 @2; Baltimore, per barrel, \$1.25 @1.50.

Tomatoes—Florida, per carrier, \$2 @4.

Turnips, Russia, Can., car lots, per barrel, 50 @75c.

Imports of potatoes from Great Britain, 200 sacks; from Bremen, 400 bags; from Hamburg, 1,400; market steady at the following prices: Long Island, in bulk, per barrel, \$2.50 @2.75; Jersey, choice, round, in bulk, per barrel, \$2.12 @2.25; fair to good, in bulk, per barrel, \$1.75 @2; State and western, choice, in bulk, per 180 pounds, \$2.25 @2.37; western, fair to good, per 180 pounds, \$2 @2.12; fair to prime, per sack, \$2 @2.15; sweet potatoes, Vineland, fancy, per barrel, \$3 @3.50; Vineland, fair, per barrel, \$2.25 @2.75; South Jersey, per d-h barrel, \$2.25 @2.75; Monmouth Co., per barrel, \$1.75 @2.25; yellow sweets, Va., per barrel, \$1.50 @2.

## Boston.

Apples continue in healthy demand. While some very fancy Greenings would bring \$3.25, that quality is so rare that it might be better to name prices at \$2.75 @3; Baldwins are in better call \$3 @3.25 at wholesale, with retail prices 25 @30c. higher. The market is almost bare of what are known as fancy table apples; Ben Davis pleases the eye, but is not satisfactory to the taste; fresh receipts of Ben Davis that means not from cold storage, are about over; Talman Sweet's are wanted. This must not be construed, however, to be in large quantities.

Cranberries unchanged \$5 @7 a barrel; \$1.75 @2.25 in crates; fancy stock is either bringing a little bit more money. Egg plants \$3 a dozen.

Sweet potatoes are higher, Virginia \$1.75 @2; Jerseys \$2.75 @3; very light supply of the latter.

Spinach steady 25 @40c. a bushel; hothouse cucumbers rather quiet \$1 @1.25 a hundred; some Florida stock offered finds little or no sale.

Cauliflower home-grown, nearly done, takes a range according to quality of \$2 @3 a dozen. Brussels sprouts 10 @15 a quart. Cabbage firm 4 @5c. a head.

Leeks 40 @50c. a dozen bunches. Parsley 75c. a bushel. Artichokes \$1.25. Carrots 75c. @ \$1. Parsnips 50 @60c. Beets 50 @60c. No Korn here, there is a continued demand for it, price showing but little change.

Florida string beans \$2.50 a basket; some very fancy \$3.

Lettuce in fair demand, generally so small heads that we are forced to give a range in price 25@50c. a dozen, with a quick demand for anything good enough to bring the latter price.

Mushrooms hold their own 40@60c. a pound.

Hothouse tomatoes have a fair sale 20 @30c. a pound; a few California tomatoes packed in the four basket carrier bring \$2, but only in a slow way.

Gros Colmar grapes wanted at about \$1 a pound; Hamburgs 50@75c.

Potatoes are very steady; white stock taking the preference at all times; Green Mountains, Hebrons, Rurals or White Stars from 75@85c.; red stock being at a discount, is sold largely to the peddler trade at prices varying from 60@75c. This city at present time is receiving quite a good many potatoes from Michigan. We are pleased to say the stock give satisfaction.

Fancy Hubbard squash, selected stock, hard-shelled, is bringing 2½c. per pound. Bay State being largely brought forward in barrels is a little bit firmer, \$1.25@1.50. Turbans unchanged at \$1.50.

Celery is being eaten everywhere; "Boston Market" takes the preference; this variety is pleasing our New England people; it brings \$1.50@1.75 a dozen. Other varieties not so popular, find a trade at about 50c. a dozen.

Onions can easily be quoted at \$2.25 a barrel.

White French turnips in little better demand at \$1@1.25; yellow, \$1 a barrel; Flat Purple, 75c.@\$1; while the Globe Purple, seeming to be of a finer grade, bringing \$1.25 a barrel.

Radishes make the tables look well, and move at 25@40c. a dozen. Mint 75c. a dozen. Oyster plant 75c. a dozen.

Duchess and Clairgeau pears are out of the market; Beurré Bosc easier \$3@4 a bushel; very little demand anyway; Anjou slips along, \$2@3 a bushel.

### Philadelphia.

Sales have fallen off considerably in this market during the past week; stock has been scarcer and most prices have ruled firm. Receipts of apples have been lighter, and desirable fruit is held firm. Florida oranges are in moderate supply with a fair demand.

Potatoes are higher and receipts have been light, the demand has been for choice stock.

Prices as follows:

Apples—King, choice and fancy, per barrel, \$3.25@3.50; Winesap, choice and fancy, per barrel, \$3@3.25; do., fair to good, \$2.25@2.75; Ben Davis, choice and fancy, per barrel, \$2.75@3; do. fair to good, per barrel, \$1.80@2.25; Rome Beauty, choice and fancy, per barrel, \$3@3.25; do. fair to good, \$2@2.75; Greenings, choice, per barrel, \$2.75@3; do. fair to good, \$2@2.50; Baldwin and Spy, choice, per barrel, \$2.75@3; do. fair to good, \$2@2.50; mixed varieties, choice, per barrel, \$2.50@2.75; do. fair to good, \$2@2.25.

Florida oranges, per box \$3@3.50; grape fruit, per box, \$5@6.50.

Cranberries—Cape Cod, fancy, large, dark, per barrel, \$9@10; do. choice, sound, per barrel, \$7@8; do. medium, per barrel, \$5.50@7; do. per crate, \$1.75@2.50; Jersey, per crate, \$1.50@2.

Celery—Choice, large, per dozen, 40@50c.; fair to good, per dozen, 25@30c.

Brussels sprouts, per quart, 5@10c. Cauliflowers, choice, per barrel, \$2@3; fair to good, per barrel, \$1.25@1.75.

Receipts of cabbage have fallen off, and the market is firmer on choice stock, averaging 6-8 pounds per head, \$2.50@3.50 per 100; averaging 4-6 pounds per head, \$2@2.50; lighter heads, \$1.50@1.75 per 100.

Cucumbers—Florida, per crate, \$1.25@1.75.

Onions—White, per barrel, \$3@4; yellow, per barrel, \$1.50@2; per bushel 70 @75c. for choice, and 60@65c. for fair stock.

Potatoes—Choice, per bushel in car lots, 72@75c.; fair to good, 65@70c.

Jersey sweets, per basket, 50@55c.; do. seconds, 25@30c.; Southern sweets, per basket, 30@40c.

# OUR CLUB LIST

LET US FILL YOUR ORDERS FOR 1898.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

Orders to

AMERICAN GARDENING, P. O. Box 1697, New York.

We Call on every reader to secure us at least one new subscription now to **AMERICAN GARDENING** for 1898, so they will not miss any of the following offers and inducements:

## Prospectus for 1898

### All the Good Things Continued

Which have made **AMERICAN GARDENING** the standard publication of the Horticultural world, and given it more bona fide subscribers than all other Horticultural papers combined.

### Cash Prizes Offered Every Week

For Photographs of Well-grown Specimens (flower, fruit, vegetable or plant), with description as to how the result depicted was attained—from start to finish.

### Cash Prizes Offered Every Week

For Best Answers to Question Box. This department is absolutely free, and there is no necessity for any reader to remain in ignorance on any subject which may puzzle him.

### Colored Art Supplement Every Month

Free to every subscriber.—Beauties all. Every one values a good picture. Ours will be more than good.

### Cash Prize for Best Essay

On a Subject of General Interest. One Prize every month.—This feature we expect to prove a drawing card.

### Literary Supplement Monthly

Special Feature for Advanced Readers, containing articles of more permanent and scientific interest.

### New Writers on New Subjects

Which we know our readers will appreciate.

And with all this

{ Array of  
Attractions

## We Give Premiums

To those who obtain us a new subscription as well as to the new subscriber. See advertising columns.

Don't fritter away your time and money on worthless reading. Subscribe to a practical publication, admitted by all the standard authority of the age and country. Take our advice: Talk American Gardening to your friends, get their subscriptions, and they will bless you evermore.

## STANDARD FLOWER POTS

Send for our new price list with extra discounts. All of our pots from 7 in. and upwards have our Patent Excelsior Bottom, which is a great advantage, as it secures perfect drainage. A Full Line of Bath Pans.

FIG. 236.—"A LITTLE SUCCESS WITH A HOTBED."

### A Little Success With a Hotbed.

The subject of this little sketch is a frame made of 2-inch chestnut plank 6x7 feet by 18 inches high in front, by 36 inches high at back, supporting two 3x7-foot sashes, hinged at the back to the frame, over which 4 inches thick, straw and board covers, hinged at the sides, are used in severe weather to keep out frost.

The frame was made in the spring of 1896 (in March) and set in its present sunny location with southern exposure, and moderate slope to the ground southward.

After leveling the frame, a pit was dug within 3 feet deep, extending back to within one foot of back wall of frame, this allowance of soil undisturbed, having been left for the purpose of planting in the natural soil three Marechal Niel Roses, one in each corner grafted on Manetti stock, and one in the center on its own roots, all of which were planted soon after the bed was made up.

As soon as the pit was dug and ready, it was filled up from the bottom for 2½ feet with good hot stable manure, and well trodden down, then covered with 6 inches of good loam, sand and well-rotted cow manure in about equal parts. After a week of rest, radishes and lettuce seed were planted in the bed, they came up with surprising quickness, and in four weeks the crops of each were ready for the table, and to be sure, were relished greatly for having come so early out of their season.

A succession of crops was kept in order with good success by simply placing the seed where plants were removed, until the regular garden product was ready to take its place.

During the summer the frame was used as a storehouse for such house plants as liked heat, and for striking cuttings in wet sand, which all proved themselves worthy in their modest tropical luxuriance after getting their root hold.

The Roses after cutting back to one bud, at planting, each made vigorous growths of 10 feet or more during the summer, and when the bed was made up (as previously) in the following November, the vines were cut back to within 5 feet of the stock or trunk, all laterals removed, and tied up for the winter. No blooms the first season.

Having prepared myself for a supply of lettuce plants for this second bed, in the early fall, by planting seed in the garden, I transplanted about five dozen four to six leaf plants in the bed rather closely, and by December some were well headed, and as fine as any Boston Market you could find in the stores.

I kept up a constant succession of this lettuce until March, through the winter of '96 and '97, by previously having set a large spadeful of the plants from the garden, (earth attached) under some old window sashes that laid over a crude frame of boards sunk in the ground, which served as a model cold frame in its way for storing this needed supply of lettuce.

Over 100 heads of fine lettuce were taken from the frame during the four winter months and a small crop of radishes was matured in January between the lettuce plants.

Whenever a head or more of lettuce was removed from the bed, the vacancies were filled in from the plants in the cold frame which were always easily removed. The coldest night of the winter, according to memory, was about 10 degrees below zero, but with the protection I had in covers and about a 10-inch wall of leaves boarded up around the frame, which was done in the early winter and not previously spoken of, the temperature could not have gone lower than freezing during the coldest nights, as evidenced by a small Otahelte Orange tree, a Palm, Palmetto, etc., having withstood the temperature without apparent harm; but some Pineapples rooted in pots were chilled beyond recovery. The Orange tree turned somewhat yellow and lost its winter blossoms, but is now in the house in fruit and in bloom.

In the spring of '97 the bed was left untouched as far as renewal of heat was concerned, and in April about the first of the month, the Rose vines began to show their first signs of new growth, which continued throughout the month with great rapidity, each lateral supporting a fine bud at its end.

By the first of May the first bloom was ready to be cut, which it certainly was, and with an immense amount of satisfaction; it was of such exquisite fragrance—well, you all know what the Marechal Niel is.

On the 8th of May the accompanying photograph fig. 287, made by myself, shows, actual count, 26 full blooms and 44 buds ready to burst, with numerous smaller ones, as well as some remaining lettuce plants, etc.

During the month of May, which ended the Rose season, 84 (actual count) blooms were cut from the three vines, and three blooms from a Marechal Niel in a pot, one of which was very large, beautifully colored and scented.

The vines have all made an enormous growth during the past summer and were well cut back at the renewal of heat this November, three or four 6 to 8-foot canes having been left for blooms next spring. The bed now contains young lettuce plants under good headway and some radishes well up from the seed.

The extra views (fig. 286) are of the bed and frame as at present; A shows it as it is closed, B with the straw and board covers laid back, and C with the sashes raised and held by their pole supports which are hinged to the sashes with brass screw eyes, and which afford a great convenience in keeping the sash raised, when needed.

The actual cost of this frame and sashes with covers, etc., was \$16, and it costs from \$2 to \$2.50 to renew the heat, including the labor of putting it in.

Any further attention must be given by the owner for the luxuries it contains under proper management, which is nothing but simplicity to say the least, and one will get considerable horticulture, floriculture, gardening, etc., or anything you choose to call it, in a modest but practical way, by being the fortunate owner of such a box.

J. W. WORCESTER, M. D.,  
Middletown, N. Y.

### The Fruit Garden.

At this time of the year an observing man will compare the gathered notes of the year carried from exhibitions, visits, and visitors, personal thoughts and failures. These, the failures, are good lessons for many persons, and are seldom forgotten, and in the real workman produce a determination to learn the cause of them, if possible, so as to avoid them in future. If you keep such notes you will be surprised at the number of ideas noted, that your memory has failed to retain.

#### Plan for Next Year.

Plan exactly what you intend doing next year. If you set it down, more thoughts will likely be given to it, and some improvement made before the time comes to commence the work.

As regards any stock you expect to buy in the spring, get it down on paper, noting from whom you intend to order. Visit, and personally select it if you can; if you cannot, but know exactly what you want, always add to your order. "No substitution."

#### Substitution.

In this we have a real bugbear. The nurserymen, no doubt, act in good faith when they send some other variety of about the same season, and, as they generally put it, "just as good." Possibly it is, in their locality, in the line of being hardy; but the trouble is they do not know what you have, only what you ask for, and in substituting will more than likely send you something you already have, or that had not proved satisfactory with you in some particular. Most of us know there are certain varieties of fruits that are not adapted to some section. While a few will perhaps fruit first-rate in your locality, these can be planted in quantity. The majority are only to be experimented with, expecting to obtain something better. Therefore, it is not at times agreeable to pay for more of what is not wanted. But it may be your own fault in not reading carefully the condition of sale, or if you did, forgetting to add "no substitution." J. HOLLOWAY, L. I.

### Beet Sugar Making at Home.

In reply to an inquiry addressed to him by the Agricultural Epitomist, Dr. H. W. Wiley, of the Department of Agriculture, writes:

"The production of a crude beet sugar in a small way is an extremely simple process. Any farmer who is equipped with a cider mill for rasping the beets, a cider press for expressing the juice, and an evaporator suitable for making sorghum molasses, can produce a crude beet sugar. As a rule, this sugar will not be very palatable, because it is not refined and contains the salts and bitter principles which make raw beet sugar and beet molasses, as a rule, unfit for table use. Farmers should not be deceived by the expectation of being able to make their sugar in a successful way commercially. The successful and profitable manufacture of sugar can only be accomplished in expensive factories, equipped with all the appliances necessary to make a pure refined sugar."

Profitable Lettuce Forcing.

To the Editor of American Gardening.

In answer to W. R. Meserole, who inquires on page 827 as to what is profitable lettuce growing, I will state for his information that the work done by me in the New York Experiment Station, Geneva, under the direction of the late Dr. Peter Collier, director, was the practical forcing of choice winter vegetables under glass, for the purpose of finding if the business would pay. It was a most interesting work to all those connected with the station, and the public watched closely. Correct accounts were kept of all produce.

The greenhouses are in three divided compartments, one of 60 feet and two of 44 feet in length, and in width 20 feet. There are four raised benches, each three feet wide and heated by hot water. The lettuce house was 44 feet long and heated to 50 degrees in coldest weather; the English cucumber house was 44 feet

long and heated to 70 degrees in coldest weather; while the tomato house, 60 feet long, was heated to 60 degrees in coldest weather.

At both ends of lettuce house each side of the doors, the benches were kept for growing successional crops of radishes all winter, thus shortening my lettuce benches by 12 feet, and one bench out of the four was kept for potted plants which left my full capacity of bench room for the production of lettuce, each crop, 39 dozen.

Mr. Meserole quotes from my original article that "the first sowing was made September 5, and 70 dozen heads were sold by the end of December." That is correct. My first shipment of lettuce was on November 1, and the space was immediately replanted with potted plants from my stock bench; these were more than half grown and received not the slightest check in planting.

The remainder of the 70 dozen sold by the end of December was taken from my second crop of lettuce, and a large por-

tion of my third crop was planted the first week in January. Successional plantings from my stock potted plants were continued until the last week in March. There was good demand for lettuce all through the month of April.

I sowed my lettuce seeds thinly in flats every two weeks, several varieties each time, potting, as soon as fit to handle, into two-inch pots and plunging them to the rim in the stock bench where they remained until required for planting.

My first and second crops of lettuce were from the sowings made on September 6, and were kept back by a system of transplanting in flats, until those planted in the benches were sufficiently advanced, and then potted in 2-inch pots and plunged in stock bench.

From September 6 to April 24 I raised six crops of curled lettuce on the same benches and in the same soil, and the last crop was equal to the first in size and quality. After each crop half a pound of bone meal and two handfuls of

those from pots will be stocky and of better quality and of more even growth. I have proved satisfactorily that I was 15 days earlier with each crop of lettuce by pot cultivation; if transplanted in the ordinary way the plants are one week or more before getting established again.

There are good growers of lettuce in Geneva, N. Y., who make a business of it in winter. who, when the station commenced to sell lettuce to prove the experiment, were obliged to ship to Rochester.

Mr. W. E. Meserole acknowledges his limited experience and his difficulty in raising two crops in six months, and when he says 80 to 90 degrees is none too much for lettuce, he has much to learn before he becomes a successful or profitable grower.

In my former article, however, I did not say I had raised six crops in six months; but I said it can easily be done throughout the winter.

WILLIAM THOMPSON.

[The raising of lettuce and mushrooms on the above system forms the subject of Bulletin 88 of the Geneva (N. Y.) Station.]

FIG. 237.—SUCCESS WITH A HOTBED. (See page 858.)

Practical Strawberry Culture.

To the Editor of American Gardening.

Although I have an experience of thirty-five years in strawberry culture still I am satisfied since reading Mr. Jerolaman's recent letters that I have much to learn. No doubt plants from runners layered in July in fertile soil, transplanted in October would yield a full crop of fruit the following spring, but if Mr. Jerolaman can take an average size Henry strawberry plant sent out in October as a premium, set it out in open ground on his place and obtain from it as much fruit as would be yielded by a strawberry plant having a full season's growth, our understanding of a full crop, then of a truth his process producing this result is of far more value than any claim in Klondike.

While waiting for the unfolding of this secret I will, with your permission, give to your readers a brief statement of my method, by the following of which satisfactory results at least will be attained:

My ground is a light loam, southerly exposure, underlaid by a bed of gravel, thus naturally underdrained. My strawberry crop forms one of a rotation of three, covering two years.

In early spring I spread on the plot a coat of well-rotted stable manure at least an inch thick. As soon as the ground can be worked this is plowed or spaded in. As soon as seasonable an early crop—potatoes, corn, peas, etc.—is planted to be harvested in July. The ground is then again plowed or spaded up in preparation for the strawberry plants which are taken from the earliest runners of perfect flowered varieties which have not been allowed to fruit. In favorable seasons the planting can be finished by August 1, thus giving the plants at least three months for growth.

As but one crop is expected the plants may be set quite closely. For hand culture one foot apart in rows, first, second, and third rows 18 inches apart, next row two feet away for convenience in gathering fruit. For horse culture, rows

wood ashes to each square yard, were sprinkled on the soil and the surface loosened up with a trowel. The potted plants were taken from the stock bench and the pots plunged in the soil at equal distances apart, the rim of each pot being half an inch below the surface. The lettuce thus treated will receive no check whatever and will quickly put out roots into the surrounding soil, and rapidly advance to perfection. Lettuce grown in this way is large, stocky, and even in growth. The temperature in lettuce house never exceeded 65 degrees by day, and in cold spells at night it often lowered to 45 degrees.

The results of this house, 44x20, are given here: 224 dozen of lettuce, 198 pounds of mushrooms grown under lettuce benches 29 feet long by 5 feet wide; 14,000 radishes grown on 36 feet of benches, 3 feet wide. Lettuce planted in pots in one bench from the same lot of seeds and others transplanted in another bench in the ordinary way, will both arrive at maturity at the same time, but

must be at such distance apart as will permit its passage between them.

About two weeks after setting or as soon as the plants are well established, apply around—not on—each plant a dessert-spoonful of bone meal. The culture thence through the season is to keep the ground mellow and free from weeds removing all runners as soon as formed.

When winter has set in, usually early in December, fill the spaces between the rows with well-rotted stable manure to a depth of at least two inches, also covering the plants to about half that depth.

About April 1 the new growth will commence forcing its way through the covering which may be raked from the crowns of the plants, but left closely around them to act as a mulch.

As soon as the crop is gathered the plants are plowed or spaded under in preparation for celery, potatoes, turnips, or any other late crop. This finishes the rotation, giving as stated, three satisfactory crops in two years.

MYRON H. KELSEY, Jersey City, N. J.

### Vegetables Under Glass.

To have forced vegetables during the winter is quite a luxury. A well-managed vegetable house should have crops coming on all the time; it is then an easy matter to keep up a supply.

#### Asparagus.

In forcing this choice vegetable it is essential to have very strong roots; they should not be less than four years old, five or six would be better. The space under the benches of a cool forcing house is a good place to grow them. Place three or four inches of good soil under the benches; the clumps are then placed as close together as possible, and some good soil is filled between them. The crowns are covered with three or four inches of soil, of which about half is leaf mould; it holds the moisture better than common soil. The heat should be kept rather low for a few days; after that the temperature may rise from 50 to 55 degrees. For a succession, new roots should be planted every three or four weeks.

Roots should be dug up now, care being taken not to break the clumps, and retaining all the soil possible around the clumps; they may be piled in some shed so as to be had as wanted. Cover with some soil or litter so as to keep them from drying out. They will not hurt to freeze, indeed, it adds to their value for forcing.

#### Cauliflower.

Cauliflower that is intended for the holidays will need close attention; the plants should not suffer for the want of water; their capacity for water is more than that of the majority of vegetables, but be careful and not get the soil sour. The plants can be watered two or three times a week as the occasion may demand. The ground should be frequently stirred. Give abundance of air on all favorable occasions and don't forget to give them manure water once or twice a week.

#### Beans.

When sowing beans now one should be careful not to plant too deeply as they

are apt to rot, with a mere covering, germination will be quicker. It is a good plan to sow thickly, and when the plants are large enough, thin out. Ne Plus Ultra does very well with us.

#### Lettuce.

Lettuce is generally considered to be a necessary crop to grow, but judgment must be used as the short days are on us, for by carelessness a crop is easily ruined. Keep the plants vigorous by keeping the soil stirred with the weeder, and strict attention as to ventilating. In order to have a regular supply, plantings should be made every 10 or 15 days. Lettuce must have a low temperature—from 40 to 45 degrees at night suits

FIG. 238.—NEW TYPE OF SALPIGLOSSIS.

them best. Sometimes the green fly becomes troublesome, but don't let it get a foothold; fumigate every week.

JOHN J. FARRELL, Conn.

### Some Continental Novelties.

Herewith we present some illustrations and notes upon a few novelties introduced by F. C. Heinemann, Erfurt, Germany. They will likely be offered by our seedmen this next season.

#### Salpiglossis variabilis superbissima.

The Salpiglossis is one of the greatest favorites among our annuals. It has now this high place partly by its easy culture, but principally by its beautiful, and in their design almost orchid-like flowers, which it produces during the whole summer. My novelty shows a very marked and striking distinction in habit as well as in its flowers, if seen in the dis-

tance or closely examined. It forms only one single leading stem, which often grows as thick as a finger, and bears on its end a bouquet of the most beautiful flowers. Every one of them is richly veined with gold and considerably larger than those of the old "grandiflora" type. There is about as much difference between these two varieties, as is between a *Petunia superbissima* and a common *Petunia*. The throat is wide open and short. The edge of the flower is not so deeply incurved as with the old variety, which gives it a more round shape.

#### *Petunia hybrida* "Snowball."

A new, very dwarf variety that comes quite true from seed. Its beautiful, satiny white flowers are well shaped and cover the whole plant with one mass of blooms. Admirably adapted for bedding and pot culture. It stands heat and drought equally well.

#### *Begonia hybrid gigantea cristata.*

The surprising characteristic of this startling novelty is, that attached to the petals is an irregularly fringed appendage, closely resembling a beard, which gives the flower a most elegant appearance. It has been awarded by the French National Horticultural Society a first-class certificate, and all connoisseurs shower their warmest praise on this grand variety, which will cause a sensation wherever it may be met with. To the mixture of the rich shades of terracotta I have been able to add a brilliant red, pale pink, and pure yellow.

### Home Forcing of Lettuce.

To the Editor of American Gardening.

I have noticed several communications with regard to the growing of lettuce under glass, have read articles by Mr. Thompson and others who seem to be making something difficult out of what is really very easy.

In the first place we should have good benches near the glass, good rich fibrous soil. Then keep the foliage dry; give plenty of air and maintain a temperature of from 45 degrees at night to 60 degrees on bright days, and use good judgment in watering. At times we do not water once in two weeks and never until we know the bench requires it, and then we make sure that every inch of soil is wet without wetting the foliage.

I grow no lettuce for market, therefore am not posted as to sorts that sell best. I grow for a private place and my people are epicures. The varieties I like best are Golden Queen and Black Seeded Tennis Ball.

For the family use I plant a bench 15 feet in length by 2½ feet wide, setting at 6 inches apart both ways; as soon as the plants begin to crowd I take out every other one, which are fairly good. At the last cutting every one has a perfect head like a little cabbage. As soon as we make our last cutting I replace with plants which have been potted from seed flat into 2-inch pots, so that we have a succession all winter.

J. E. A., N. Y.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

## Girdling for the Canker Worm.

At the present time in most sections of the country war may be waged against the spring canker worm if the spraying with Bordeaux and Paris green is not a general practice. There are two species of canker worm. The fall canker worm begins to issue from the ground after the

that will remain soft above the freezing point. This treatment does not prevent the wingless female moths depositing their eggs below the band, hence in the spring the portion of the tree below the band should be washed with soft soap, or fish-oil soap to which a strong solution of potash has been added.

F. A. SIERINE.

FIG. 239.—PETUNIA SNOWBALL. (See Page 860.)

first frosts in October. The spring canker worm is just commencing to appear in this section. I was out riding last evening and noticed good many of the males of the spring canker worm flying. The freezing weather followed by a thaw is bringing them out. Of course the eggs of both species do not hatch until the leaves start in the spring. Men who make a practice of using Bordeaux mixture and Paris green in the spring at the proper time hardly know what a canker worm looks like.

After a few heavy frosts, the moths of the canker worms issue from the ground. The female, which is wingless and of a silvery gray color, measures about one-fourth of an inch in length. After reaching the open air she roams until she finds a suitable tree upon which to deposit her eggs. The male has wings of a brownish-gray color, with a white spot near the tip of the front ones. He measures from one to one and a quarter inches from tip to tip. They are now mating, and the female is depositing eggs for next spring's brood of leaf destroyers.

The egg is small, and shaped like a tumbler. One cluster, or the eggs laid by a single female, would produce between 100 and 200 small canker worms. The eggs are laid side by side, on a branch or piece of bark, and remain sealed in this way all through the winter months.

I should recommend the use of a band of cotton or wool. This should be six inches wide. The band should be wrapped around the tree and tied firmly at the lower margin, then take hold of the top and turn it down so as to form a cone around the tree. The band should be smeared with printers' ink, raw linseed oil, axle grease, or any viscid oil

## Raspberries in the South.

To the Editor of American Gardening.

In your issue of November 18 last, I read with much interest an article by Coy E. Chamberlain, Ga., entitled "Raspberries in the South."

Every one tells me raspberries don't succeed South. I have grown them on large areas in the North and would like to raise them in the Piedmont section of North Carolina if possible.

It would gratify all your Southern readers if you could get Mr. Chamberlain to write an article on the subject more in detail, especially as to when he cultivates, how, and how often during his first season, and also in subsequent years.

When does he apply his mulching? Does he cultivate all the spring, summer, and early fall and put his mulch on at freezing weather? Or does he only cultivate during the spring and then apply his mulch by July, or when, so as to shade the soil and roots and keep them more moist? I suspect the latter is his method, as I am told the drought is what seems to kill off raspberries.

How thick does he mulch? Only immediately around close to the plants, or all over the ground? What material does he find the best and cheapest for said mulch?

My plan North was to work them with a cultivator about once a week and after every rain, and not mulch at all. I was very successful with them, and would like to learn the most practical method best adapted to this hotter, dryer climate. Mr. Chamberlain seems capable of giving the information.—JOHN POLK, N. C.

## READERS' NOTES.

### Violet Spot.

I find that Violets grown in a subsoil of coal ashes are not much affected by the spot and do extremely well.—E. A. S., Mass.

### An Acre of Strawberries.

I believe we are promised some real live talks on strawberries by Mr. Jerolaman and others. I hope they will make it so interesting that each will try for the possibilities of one acre in strawberries—the possibilities of one acre of naturally good land, enriched for any desired crop, thoroughly prepared, intelligently seeded (or planted), and intensively cultivated when conditions are right in a good season.—A. J. MASTERS.

### Tomato Eclipse.

On page 827 Mr. Turner says Eclipse tomato is the best forcing variety, or words to that effect. As I force a few for market, I would like to have the best. Will Mr. Turner supply me with a little seed of the Eclipse or tell me where I can procure it?—STEWART RITCHIE, Newport, R. I.

### Discussion.

I for one am glad to see the sparring bouts between our fruit growers that you are now publishing in AMERICAN GARDENING. While our friend, Mr. H. Jerolaman, the king of strawberry growers, has placed the chip on his shoulder, I find in our late numbers of AMERICAN GARDENING there are other enthusiastic strawberry growers who are willing to try and knock it off. I am glad to see them try while we who are trying to raise fruit for our family use, gather

FIG. 240.—CRESTED BEGONIA. (See Page 860.)

many good thoughts and suggestions that fall from the several pens. With a little practice and patience these bouts may be the means of a better class of fruit being placed upon our tables. I say again, keep up the agitation; it's catching, for in this case knowledge is power.—F. SIBSON.

## The Strawberry Growing Challenge.

### An Error Corrected.

To the Editor of American Gardening.

In response to the two letters given in your issue of December 4, page 826, entitled "Challenge Taken Up," I wish to ask the privilege of this communication.

In my letter to you on October 26 I stated that I had with eleven men for the past two days been engaged in setting a new bed of Henry and Mary plants, in order to show all visitors next June that this bed set October 20 and 21, 1897, would outyield in profit any bed set out in spring, and that I was willing to wager \$1,000 to that effect. I am still willing to do so, and will increase the offer to \$10,000, and put the money in any Newark, N. J., bank on deposit subject to the order of the party who wins.

The conditions of the offer are that the other man must set the plants in spring as soon as he can, or as soon as the land is in good condition for setting. The plants to be set out in the same manner as all are in habit of setting in spring, in hills cultivated both ways, or in rows three feet apart; plants in rows from 18 to 20 inches apart, and to be cultivated in any way deemed best. I am to set out my plants late in fall, or soon as the fall rains come (sometimes the last of September or in October, or first of November), and to set my plants just as I have been doing for the past 20 years, the rows the same distance apart and plants in rows the same as I always do.

Each one is to keep strict account of the fertilizers used, the cost of setting out the plants, caring for them, etc., and the one that shows the larger profit is to draw the cash and keep it, provided always the weather conditions are approximately the same in both states or places where the tests are made; for instance, if the party competing against me has no rain, or hail storm, or late frosts, then in that case I would not expect him to lose his money, and the same for myself.

I am positive that it is impossible to get a larger profit from spring or summer-set plants than I do from late fall-set plants; for the past 20 years Henry Jerolaman has tried to beat it and has failed in every instance. When I cannot do it I am just as positive that the man does not live who can. Why? I will answer: Here plants set out in spring, if set in rows, are always set 18 to 20 inches apart in rows, rows 3 feet apart, if in hills, from 3 to 4 feet apart each way; the fruit stems are all picked off, going over the plants two or three times, or late stems will appear, but if the plants are small, once or twice will do. They must be kept clean all summer and fall; runners cut off, or placed in rows in order to form matted row. If the plants are set out 12 inches apart in spring, and runners let grow, they will form a large matted row. The plants set in the spring and not allowed to bear fruit and runners cut off, will by fall become large plants, and you will be compelled to keep this bed in order until the following June without one cent of profit, then the plants will be old ones with from 8 to 20 fruit

stems, and berries on such plants are always much smaller than on plants from runners set in the last of July or August.

If plants are set out in spring 18 inches apart in the row and the runners allowed to make, the latter must be placed in the row which is to be kept clean all summer, and by fall if the ground is rich you will have large matted row, plants very thick, and the old plant that was set in spring, dead or dying. It will take to keep in order four acres of plants set out in spring, from five to six men all summer and fall, and when all expenses are paid there is not over \$150 to \$200 gross; and after paying interest on land taxes, etc., the profit is but little over \$100 per acre.

If the plants are set out the last of July and in August from spring runners, and then runners cut off, the berries are much larger. Less care is demanded as there are no fruit stems to cut off, and the yield per acre is about the same as before, but

FIG. 241.—A HANDY PLANT WINDOW.  
(See next page.)

the profit is about twice as much as from the plants set in spring, or \$200 per acre.

Plants that I set out during the last of September or in October are all large plants, and are set with but little more cost per acre than those set in August, although the plants are more than double the number, since some of the large bunches will contain two or three plants set just as thickly as I can put them—about 500 plants to a row 200 feet long; no water is used in setting out, so there are no palls to carry, no boxes to sprinkle, no shading in the hot July or August sun, and no rows to water after the plants are set, no cultivation, no hoeing or weeding; no care but top dressing with well-rotted barnyard manure and covering; then in spring put hay from off the top of plants between the rows and you are ready to pick. The yield will be as much if not more berries, just as large as if the plants were set in July or August, and much larger than the berries from plants set out in spring. I will stake my life against a \$5.00 bill for the benefit of the poor, that the profit

is at least double that from any plants set in spring as spring plants are at present set.

I know of what I am talking. I do not wish to deceive anyone, and I ask no one to take my advice. I am not here to injure any one (or am I here to brag). I only tell that which I have found to be true in every way for the past 20 years. If I had not found a way to grow four acres of strawberries without the help of five to six men each season for at least six months each year, compelled to pay (as we are for good help here) from \$9 to \$12 per week, why at the present time I would not have a single dollar of my own, but would have been compelled to go at something else, or if alive be the occupant of some poorhouse. This is my own dose, which I have taken for more than 23 years, and during all that time I have grown some few rows to always test the profit of spring or August-set plants, and in every instance the plants set out late, without expense other than for setting, have given more than twice the profit.

Plants set out in this latitude in October or November are liable not to get firmly rooted before the ground freezes, and I always have my manure ready to top-dress as fast as I set. This is put close up to the crown of the plants, and as soon as the ground freezes, I cover the plants one inch deep with salt hay at least 10 inches on each side of plant. Often during winter here the ground freezes to a depth of one foot, then rain will come and all frost goes out, frost again following, and so on for perhaps three or four times; yet for the past 20 years I do not remember losing one dollar's worth of plants set out in October or November, as the manure and mulch are a perfect protection, and in spring I find the plants firmly set and they will commence to grow soon as grass starts, and with those set out in the spring or early in the fall.

H. JEROLAMAN, N. J.

### Velvet Bean.

The velvet bean, *Dolichos multiflorus* may be ranked as an ornamental climber; the flowers appear in large trusses, Wistaria-like, and are purplish brown in color, very plentiful; the velvety seed pods are also very ornamental. Velvet bean will grow on poor soil, and when once well established grows very fast. Provide brush or wire trellis for it to climb on. The large, dark green leaves give fine shade all summer.—C. FORKERT, Miss.

I received the Henry strawberry plants in fine condition; they were very fine and all will grow.—G. C., Ont.

I have neglected to acknowledge the receipt of the five Henry strawberry plants until this late day, but it is with pleasure that I am at it now. I received them in good condition. Please accept my thanks for sending such good plants.—F. A. B., Conn.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

## THE READERS' CLUB

REPLIES TO THE PROBLEMS IN THE  
QUESTION BOX.

### Weak Stem in Roses.

H. W. C., page 845, says he keeps the temperature 56 to 58 degrees at night; that is the same as we keep ours; but 76 to 80 degrees during the day is 10 degrees higher than ours. Through November and the beginning of December there have been at least two dull days for one bright one, and I don't believe in a high temperature during dull weather. While the plants may look good to the eye grown in the temperature stated, they would make a soft growth; hence the weak necks. We must build sturdiness as the plants make growth.—W. T.

### Availability of Liquid Manure.

The question asked page 845 is, in watering plants with liquid manure, how long will it be before the manure is in a condition to be assimilated by the plants. If the plants are in condition and need the liquid manure, they will take it up at once, and the grower should see an improvement in a few days, but during short days one should be very careful with the use of stimulants or it may do more harm than good; after the days begin to lengthen, there is not so much danger of over-feeding.—W. T.

### Shading for Greenhouse.

The best shading for greenhouses that I am acquainted with is naphtha and white lead. It can be mixed so that it will just break the sun rays, but if for Palms more white lead is needed. Select a bright day and see that the glass is quite dry before putting on the mixture. One advantage about this shading is it will not harm the putty and if time is an object, it can be put on with a syringe, thus shading a house in a few minutes. But if neatness is the object, apply with a whitewash brush.—W. T.

### Lettuce Dies Off.

There ought not to be much trouble in producing good lettuce under glass, providing a few simple rules are observed. In the first place, for good results, a light house is essential and by no means use green manure in mixing up a compost for lettuce; that is to say, if for immediate use. I have never had much trouble with lettuce damping off as described on page 845.

For two loads of soil, one load of thoroughly rotted manure answers our purpose. If grown on raised bench five inches of soil is sufficient. With a temperature of 40 to 45 degrees at night with a rise of 10 degrees during the day, with plenty of air on every chance, there should be no trouble with damping off, providing judgment is used in watering. When doing this give enough water to wet the soil through, but not to saturate it; as the lettuces come to the heading period they can stand being dryer at the roots.—W. T.

### The Directions of the Rows.

Both in agriculture and horticulture the rows of all vegetation should run north and south and most especially is

it necessary with tall growing crops, for the simple reason that were they east and west the broad side exposed to the south would receive all the sunshine. In the case of Sweet Peas running east and west the vines would get drawn towards the sun, and the work of supporting would never be completed, also few good blooms would be found on the north side.—D. MCFARLANE, Conn.

It is not absolutely necessary to have rows running north and south, in order to have good results with Sweet Peas, and it is not always convenient to do so. We had Sweet Peas last spring planted directly east and west and with good results; at the same time when convenient I certainly should plant north and south which allows both sides of the rows to get equal sunshine: that would mean more flowers and of better quality.—W. T.

FIG. 242.—A HANDY PLANT WINDOW INTERIOR.

### Queen Chrysanthemum.

Replying to the inquiry on page 845, the Queen has always shown an eye with us, and for that reason has been discarded. I have never seen a fully developed flower of this variety but what had the same defect. This variety also drops its petals quickly, and taken altogether, has always seemed to me a greatly over-rated one. It has a fine habit and is a splendid grower, and this probably has saved it from oblivion, but we have now so many fine whites that the Queen has surely seen its best days.—C. T.

A perfect bloom of Queen does not show the center; but I have observed an occasional plant produce imperfect flowers exposing a large center, and would suggest the cause to be either in the soil, watering, or feeding. Undoubtedly the inquirer received plants from genuine stock.—D. MCFARLANE, Conn.

The Queen Chrysanthemum requires to be extra well grown if it is not to show the center; that feature is the weak point of this otherwise first class Chrysanthemum, as it is a healthy, vigorous grower. It is not difficult to produce strong plants, which usually mean large

blooms. Quite a number of flowers will show the center after they are past their best; Philadelphia, for instance, must be cut at a certain stage or the center will open. Another year try your plants thus: Propagate in May or early June and flower the plants in six or seven-inch pots, one bloom to a pot. By this method there should be no trouble in the production of large blooms, with material enough in the flower to close up the center.

Chrysanthemums grown in six-inch pots to single stems, with foliage down to the pot, will be nice to look at or useful for decorative purposes.—Wm. T.

### Stored Celery.

It is better to cover the roots of celery when stored in trenches. Be sure that your celery plants are dry before the work of storing is attempted, and certainly never let the tops get wet after they are in the trench. If the bottom of the trench was too dry it would be indicated by the plants wilting. It takes from six to ten weeks for celery to blanch according to the variety, except self-blanching sorts, which ought to be well blanched previous to the period of storage.—D. MCFARLANE, Conn.

### The Best Chrysanthemums.

For specimen or standard plants if little disbudding is to be done, I would suggest: Wm. Robinson, red; Mayflower, white; Pres. W. R. Smith, pink, and Minerva, yellow. Cuttings to be started the first of January.

If for large blooms not exceeding three to the pot try Wm. Robinson, red; Mutual Friend, white; Pres. W. R. Smith, pale pink; Erminilda, for a darker shade; Golden Wedding, yellow. Cuttings to be started last week of March.—D. MCFARLANE, Conn.

### Medicinal Properties of Native Plants.

If the inquirer will send 50 cents to G. S. Cheney & Co., Boston, Mass., for "Druggists' Hand-Book," he will obtain a small but useful book relative to the medicinal nature of plants.—JOHN A. WHEELER, Millford, N. H.

### A Unique Plant Window.

The two illustrations presented here with show a winter window where house plants can be kept under the best of conditions, and where plants for the garden can be started in late winter. The window should be made with sides and front framed together. Then at the approach of winter all that will be necessary will be to take out the ordinary sash and screw this winter window into the casing. The front sash, which rests at an angle, should have greenhouse sash without cross bars.

The interior arrangement is shown in the second cut. Three shelves can be used, with the lower one very broad, extending about all three sides and out into the room. The upper shelf, it will be seen, is inside the line of the second shelf, and therefore does not shade it, while the second shelf can take but little light from the plants on the lower shelf, but a trifling amount if the shelf is made of slats. Any one handy with tools is ought to be able to put such a window together. But if constructed by a carpenter, the expense would be very small. W. D.

# AMERICAN GARDENING

\$1.00 a Year, Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 12, 1894.

PUBLISHED BY

A. T. DELAMARE PTG. & PUB. CO. LTD.  
ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.

Telephone, 2154 Cortlandt. P. O. Box 1697.

REGISTERED CABLE ADDRESS  
Commercial Cable) Florex, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up so Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to creditsame.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious). Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

# Announcement

The publishers of AMERICAN GARDENING, in order to increase interest among readers, as well as to add value to their paper, make the following liberal offers for 1898:

## A Cash Prize

Each week, for the Best Photograph of Well-grown Plant, with description as to how the result shown was obtained; or for other suitable illustrative photograph and text. As high as \$5.00 a week will be paid, according to merit.

## A Cash Prize

Each week for Best Set of Answers to the Question Box of the week previous. As high as \$5.00 a week will be paid, according to merit.

## A Cash Prize

Every month for the Best Essay on an announced subject of general interest. Subject for each month to be announced in due time. Essays not to exceed two columns, and \$5.00 per column will be paid for the best essay. All essays submitted become the property of AMERICAN GARDENING.

## OTHER 1898 FEATURES:

## Art Supplement Free

In colors. Once each month—to every subscriber in good standing.

## Literary Supplement

Monthly—For Advanced Readers.

What's in a Name? SOMETIMES much; sometimes nothing. AMERICAN GARDENING is a good name and will live. But a single title, however, does not always indicate all that is carried between two covers. And so it is with AMERICAN GARDENING to which we are thinking of adding a sub-title so that all may appreciate the comprehensiveness of their favorite paper. It is our intention in 1898 to make the paper so broad in its scope that every one who dwells in country and suburbs will be irresistibly drawn toward it, because they will find subjects of value to them not to be found in any other publication. We intend to cover every phase of interest in country life, excepting broad agriculture, which is now so ably cared for by many valuable contemporaries. We ask our readers for pointers in the above direction, and will pay handsomely for all articles of general interest affecting the millions who reside in the country.

The greatest encouragement our readers can confer upon us, and that which will be most agreeable to us, is the prompt renewal of their expiring subscriptions. If, with this, you will at same time forward one new subscription, you will have testified to the full your appreciation of our efforts.

## The Question Box.

Winter season is the time for study, for work does not press quite so hard. If you want information on any subject connected with life in the country, send in your question. It will have faithful attention. And if it's a question of general interest it will be covered in such a manner as not only to please you, but may be the means of aiding scores and hundreds. Also see if you can't answer some of the questions asked, and so earn one of our \$5 prizes?

## The Monthly Prize Essay.

This feature should surely be the means of drawing out some remarkably good things. If you have a subject in your mind you would like to see fully covered, let us hear from you. Practical suggestion is what we want, and \$5 a column to the winner is fairly good pay.

## Advertisers, One Word With You.

We have a large number of contracts to begin the year with. Is yours among them? If not, you may be sorry, for AMERICAN GARDENING is going to boom in the year of 1898 as never before, and it's a pity to lose good opportunities for paying investments nowadays.

## The Improved Appearance.

The improved appearance of AMERICAN GARDENING is an earnest of what is in store for subscribers throughout 1898. Notice the increased number of pages, heavier paper, more readable type. Above all, read our Announcements! Then let us hear from you if you know of any better or more valuable paper to the dweller in the country. If you do, we are open to suggestions for still further improvement. With your own renewal, send us two or three new subscriptions; that's the kind of appreciation all publishers value.

Our Poultry Corner. TO those interested in poultry—and what dwellers in the country are not?—we are pleased to be

enabled to announce that, commencing with the first issue in January, this department of AMERICAN GARDENING will be under the charge of Mr. P. H. Jacobs, one of the best-known practical authorities in the country. Thus AMERICAN GARDENING at once becomes the best paper for poultry raisers who seek prompt information, inasmuch as questions can be answered the week following. Mr. Jacobs will give all questions (which should be addressed to this paper, care of the Editor) his immediate and careful attention, and our readers can depend not only upon the sound answers they will receive, but as well upon all the varied features of the care and raising of poultry on which Mr. Jacobs will write during the year.

# Monthly Competition

A cash prize of \$5.00 per column is offered for the most instructive practical essay on

## Lettuce Forcing.

Manuscripts must be received at this office by January 1 and should be of about two columns in length. All MSS. submitted in this or any competition become the property of AM. GARDENING.

Subject for the February competition will be announced in good time.

## Answers Prize Award.

It is with pleasure that we announce the award of the prize offered for the best set of answers to the letters published in one week's Question Box. For a very interesting and valuable set from D. McFarlane, Wethersfield, Conn., the prize of \$2.50 has been awarded.

## The Henry Strawberry.

Arrangements have been made whereby a bountiful supply of these plants will be ready for spring delivery to subscribers and agents, and in this connection we beg to call the attention of our readers to our generous offer of these plants in another column. We do not think that a more liberal offer has ever been made than the one now advertised, whereby the agent or worker sending us in a club of ten new names, at \$1 each, becomes entitled to 100 Henry Strawberry plants, while five plants will be sent postpaid to each person in his club. This offer will not apply to a club of less than ten. It may be a very long time before such an offer of such a plant can be made again. The wonderful success which has accompanied our premium offer this fall, in the short time at our disposal to advertise it, leads us to believe that the orders for the Henry Strawberry next spring may exceed all anticipations; however, we have planned for a large supply for delivery and trust to be able to meet all demands upon us. Mr. Jerolaman's series of articles is now being placed in pamphlet form, and copies will be mailed free to all who desire to use same in the canvas for new subscriptions.

The Henry strawberry plants arrived December 4. They were so perfectly packed that their appearance did not in any way suggest their having journeyed across the continent to find their new home. To assure them of their welcome. I gave them the richest bed in my garden for their home and a "Heaven speed them!" to each, as I lovingly tucked it in. —J. M. WETHEREL, California.

## THE QUESTION BOX

He that questioneth much shall learn much.—BACON.

Readers are invited to forward particulars of any difficulty or perplexity that they have encountered. If the question be one of general interest it will be inserted in this column, so that other readers who may have information to impart can assist their brethren by recounting their own experiences. Questions of a purely individual interest will be replied to by the Editor under the head of "Short Answers."

Questions submitted in this department will receive the full attention of the staff of AMERICAN GARDENING and when desirable will be answered editorially.

All communications for insertion should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR of AMERICAN GARDENING, P. O. Box 1697, New York City. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query or answer are sent, each should be on a separate piece of paper.

Answers should always bear the title of the query replied to and the page on which it appeared, and our readers will greatly oblige us by advising, as far as their knowledge and observations permit, the correspondents who seek assistance. Conditions, soils, and means vary so infinitely that several answers to the same question may often be very useful, and those who reply would do well to mention the localities in which the experience was gained.

**Important to Querists.**—Correspondents must look through the whole of the paper for replies to their queries. Answers cannot always be given the week after the queries are received, but there is as little delay as possible in dealing with them.

Cash Prizes will be given for the best set of answers each week. Payment to be made monthly.

### Pruning California Privet.

What is the proper time to trim a California Privet hedge; also, should plants just set out, be trimmed now?—J. E. C., N. J.

### Propagating Shrubs from Cuttings.

What is the proper time for propagating shrubs from cuttings out of doors; I mean such as Viburnum, Escallonia, Hydrangea, Spiræa, Box, etc.—INQUIRER, N. J.

### Best Avenue Trees.

We have our private drive through a meadow for about 300 yards before it enters the highway, and would like this road shaded. We have a fine lot of Black Walnut trees about 12 feet high, and want to know if these may be planted on either side, and how far apart; also if such an avenue would accord with a gentleman's otherwise well-kept place. Or should we plant some other trees?—ROCKLAND.

### Grafting Over Large Apple Tree.

I have a large apple tree that I wish to graft entirely over into Russett apples. How large branches can I graft with reasonable chance of the grafts living, and how much of the top can I safely graft at once in the spring?—E. A. S., Mass.

### Late Celery Culture.

Is the close culture of celery, such as the late kinds like Boston Market, a financial success? I notice that the large market gardens at Allington still bank up the late sorts with earth.—E. A. S., Mass.

### What is the Best Grape.

I would like the experience of others as to the largest, hardy, best-flavored grape; black, red, or white.—A. J. M., Iowa.

### Calculating Radiating Surface.

How do you get the radiating surface of a round pipe? That is, how many feet of radiating surface are there in nine feet of 4-inch pipe.—L. M. McLAUGHLIN.

### Gloxinias in Winter.

Please give best means of keeping Gloxinias over winter. I find it quite difficult to keep them from either drying up or rotting.—WM. IRISH, Mich.

### Fruiting Seedling Grape.

Will some reader inform me how long it takes to obtain fruit from seedling grapes, and whether anything is necessary, excepting to grow the vines and wait patiently?

I ask this because a German botanist, who afterwards became a resident of Philadelphia, insists that a seedling grape will not bear fruit until it be grafted onto a fruit bearing variety. This seems to me to be incorrect because I know of several grapes now on the market that were accidental seedlings, i. e., were self-planted and were not known until discovered in fruit. This was the case with the Christine (or Telegraph) which grew in the garden in Mr. Chas. Cristine and fruited there.

I have a fine seedling of the White Almira grape, now five years old, strong and unusually hardy. The vine is nearly two inches in diameter, and this year made a growth (two branches) of 16 feet.

How long must I wait before it fruits, and is there any way of hastening this much-desired result?—EXPECTANCY.

### Mushroom Flatters.

(1.) Is "virgin" soil from an old pasture indispensable for mixing with the manure for the beds, and for casing the same?

(2.) Is it better to cover the bed with straw or litter, after casing or "solling," and is it advisable to leave it on after the buttons appear?

(3.) My foreman makes a distinction between "pinheads" and "buttons," and says the "pinheads" never mature, and are always followed by the "buttons," which latter eventually become mushrooms. I maintain that the "pinheads" are only small "buttons," which, under favorable conditions, would become full-fledged mushrooms. Which is right?

(4.) In preparing the bed should the manure be very moist?

(5.) After the appearance of the buttons in a bed which I lately made, only a very small proportion of them matured; or, in technical language, "the buttons got stuck." Was this caused by insufficient watering—they were on the dry side—and if so, how often should the bed be watered?

(6.) In our mushroom house there are two rows of benches, one over the other. Is it likely the top benches would be as productive as the bottom ones? And, would they be better still on the floor?

(7.) The benches are wooden with iron uprights. Could it be possible that the iron would be in any way injurious to the mushrooms? Robinson says they do not like either coal or iron.

(8.) Are salt and nitrate of soda in solution beneficial?

(9.) Is darkness necessary? Or is a certain amount of light and air beneficial?

(10.) What is the best depth for the beds?

(11.) Are shavings, leaves and sawdust, when mixed in with the manure, likely to produce spurious fungi?

(12.) For how many square feet of bed should 25 pounds of spawn be sufficient?

(13.) Are mushrooms a paying crop?—AGARICUS.

### Short Answers.

(To J. McL.)—By hot water under pressure is meant that the system is closed, the hot water thus being pent up makes a pressure. In the usual system of using hot water in greenhouses there is an open or expansion tank, when, of course, the water is not under pressure.

(To J. McL.)—The seed described is no doubt that of a Trapa, the water chestnut. Please send a sample of your moss, etc.; we cannot undertake to give names otherwise.

(To W. Reid.)—The plant sent is *Andromeda media*.

### Our 1898 Art Calendar.

I found the Calendar exactly as represented. It is so much nicer than those advertising ones. I was very glad to have it.—MISS H. LINSLEY, Conn.

Your Art Calendar for 1898 received in good order. It is beautiful, admired by all who see it and it gives us much pleasure in our home to show it to callers. Hoping you will receive the recompense your labor of love deserves, with kindest regards to AMERICAN GARDENING and thanks.—ROBERT LEITHEAD, Cal.

I have been a subscriber to AMERICAN GARDENING when it was a monthly, semi-monthly, and weekly, and have taken great interest in its improvement. It is the paper for the amateur gardener. Many thanks for your really beautiful Calendar.—CHR. CHRISTOFFERSEN, Utah.

I received Art Calendar for year 1898 all right, and my family and myself are very much pleased with it. I think it far surpasses anything in the calendar line that we have yet seen, and we have had some very beautiful ones heretofore. It is admired by all who see it. Should be in the home of every family.—PHILIP HARRIS, Pa.

Your Calendar received and I must say it is a daisy; anyone who loves flowers and nice pictures ought to subscribe to AMERICAN GARDENING at once to secure one of these. I take six horticultural papers, but AMERICAN GARDENING beats them all. It gives more short practical notes than any one I have, and these are valuable to every amateur gardener, florist, and nurseryman.—J. U., Iowa.

Your premium Calendar received, and I am justly pleased with it. The color work and the harmonious effect are simply grand. It is indeed an Art Calendar of the first class, and in my estimation the handsomest calendar of its kind out.—W. D. BUSSING, N. J.

The AMERICAN GARDENING Calendar for '98 to hand. It is a work of art founded upon the most beautiful creations of nature—the woman and the Rose—in all their moods of the seasons. It is a credit to the publishers and a delight to the recipient.—G. N. CARUTHERS, O.

Your Calendar for 1898 received. It is all you represented it to be and we are very much pleased with it.—A. DRAPER, Mass.

Your Art Calendar duly received, for which allow me to thank you most heartily. My family and myself were simply delighted with it, and consider it a work of art indeed, fitted to embellish the finest parlor in the land.—ADAM SHAND, New Brunswick.

We are very much pleased with the Calendar you sent with the paper.—JAS. ALLEN, Mass.

Your very neat and artistic Calendar for 1898 has been duly received, and greatly admired for its usefulness and beauty by every member of the family, and when once seen I believe would be a great inducement for obtaining many new subscribers for AMERICAN GARDENING.—F. A. BERNHARDT, Conn.

The Art Calendar ordered from you is at hand, and I consider it the handsomest I have ever seen. I have given it a prominent place in the parlor and am very proud of it.—W. B. WOODRUFF, N. Y.

Received the Art Calendar safely, and was well pleased with it. It is an ornament to any home.—D. H. MANN, Mass.

Please accept thanks for the handsomest Art Calendar for 1898. "The prettiest Calendar ever received" is the family verdict. We consider AMERICAN GARDENING worth many times its cost, and with the handsome premiums no one who has any interest in garden products, need hesitate to subscribe for it.—D. S. HANKINS, Pa.

Your Calendar received. Kindly accept many thanks for same, as it is perfectly exquisite.—C. W. PRUSSIA, N. Y.

## Mr. Jerolaman's Berries and Claims.

To the Editor of American Gardening.

I wish to thank Mr. Wooster for his article in AMERICAN GARDENING of December 11, and I shall watch with much interest for the reply by Mr. Jerolaman, but if it is no more to the point than his last reply to Mr. Wooster, it will certainly not amount to much, for that was just no reply at all. I must confess I have had a hard job to swallow some of Mr. Jerolaman's big berries—some of those "18 inches in circumference" ones! A berry 18 inches in circumference will be about 4 inches in diameter, and only one such berry could be put into a quart strawberry basket. Just take your tape and measure around the top of a flower pot and see how large 18 inches is.

Mr. Jerolaman says he has grown during the past season thousands of quarts of berries, of which it took only from 5 to 10 berries to fill a quart box heaping full; well, I have grown some large berries, but nothing like these. The past season my strawberries brought 25c. per box, the first of the season, and none of them less than 20c., while other local growers were getting from 9c. to 12½c. My Mary strawberries were very large, but they did not come up to 5 or 10 to the quart.

I am interested to learn how Mr. Jerolaman grows strawberries and, as he says in his letter to Mr. Wooster (page 847) "has no runners to cut off." One would suppose that if his land is made rich enough to produce 18-inch berries there would be a good supply of runners, which if left to grow would completely cover his ground. What a help it would be to me, and no doubt to others too, if he would just tell us how he does it.

One statement made by Mr. Jerolaman in his letter to Mr. Wooster, is very encouraging to me. He says: "I honestly believe that I have learned all that it is possible to know about strawberries!" Now, if he will only tell us all about it through AMERICAN GARDENING, we can stop experimenting and trying new methods of culture, and sit down to take life easy.

I am certain that if Mr. Jerolaman's method of setting plants in the fall is carried into general practice, it will result only in disappointment. This method may be best for Mr. Jerolaman, but outside of "Boyden Farm" there will be nothing gained by setting layer strawberry plants in the fall. Of course one can get a few berries from such plants, but it will be at the expense of the next season's crop. I cannot but think that Mr. Jerolaman's articles have been misleading to many people just starting in growing strawberries, (the old heads will not be caught.) Please note his claim, he has grown the Henry for four years or more, and not a single plant has ever died, either old or young. What a record! The berries grown on four-year-old plants are just as large and fine in every way, as those grown on young plants! It is also the earliest as well as the latest to ripen. I will give any man \$10 apiece for strawberry plants such as the Henry is claimed to be. Yet Mr. Jerolaman offered me 100

of the Henry plants at \$2. (This was before his deal with the AMERICAN GARDENING.)

I am really glad Mr. Jerolaman will "fully revise his series of articles on 'Big Berries For All' before it will be issued in booklet form."—A. A. HALLADAY, Vermont.

To the Editor of American Gardening.

I was much amused to read Mr. E. W. Wooster's comments concerning "Mr. Jerolaman and his methods of Strawberry Culture." It appears that he does not like this new king to keep him waiting for this new or old method of strawberry culture.

I do not know what he or any one else means by calling me king; if a king be one that perfectly understands his subjects and all their needs, or one that is master of his trade or business, then I am confident that I am a king indeed, and I can say with perfect truth that I am master of strawberry culture in all its parts, in every stage, in every little detail, and if it were not so, I would have gone out of the business 22 years ago. My farms, my strawberry beds, my sales from year to year, my credit at the Newark City (N. J.) National Bank (all readers are at liberty to write and find out my standing), all prove that I am master of my business. And when I say that the largest profit I make is on the plants set out when fall rains commence, about the last of September and in October, I mean just what I say.

I am sorry to learn that Mr. Wooster is jealous of this new king, and is afraid that the Editor will do harm to publish his methods. This proves to my mind that Mr. Wooster is honest in his belief that no one should injure his fellow man, and if Mr. Wooster is as confident that he understands his business as I am that I understand mine, then the Editor should do him justice and call him king too. Then between the two kings we ought to keep the readers of AMERICAN GARDENING well posted on strawberry culture, and if between us we should get the Editor on the fence, I think he would know which way to jump because he has seen my farm and strawberry beds.

When I commenced to write I was well aware that there were many Mr. Woosters in the United States, and that some of them would get angry or jealous, and so inserted the words Mr. Wooster has quoted, that I did not attempt to improve or instruct those already in the business. I do not attempt to ripen maturity. Unlike Mr. Wooster, I have for the past 20 years found that the safest time to set out strawberry plants is when the ground was wet or damp in cool weather and, to save one year's expense, to set in fall, receiving my profit and pay without waiting one year; and I will defy any one to prove that I have ever in the past 20 years lost one dollar's worth of strawberry plants set in September, October, or November, by reason of their being thrown out by action of frost in freezing and thawing. Why? Because I always have my manure ready to top dress soon as plants are set.

On my return home from the South I am told it has been freezing and thawing here since the last days of November. My man tells me that he did not finish

covering the plants with salt hay until December 4, but that the manure was all on before that time. I removed the hay to-day from the plants I set November 8, the day before I left, and found every plant just as I set it, not a single one had moved a particle, and I will guarantee that in spring they will never know they were moved in the fall, and in June next will grow just as large and just as fine fruit as any plants that I set in spring and in August last.

Come on, Brother Wooster, in June next and learn something. You will not find me such a bad king as to advise others to lose time and money, and if you want my crown I will give it to you, and you can wear both; like Sancho Panza, one day suffices me to be king, ruler, or governor. For the past 20 years I have received letters directed to the strawberryman or strawberry king of New Jersey, and AMERICAN GARDENING was not the first to give me that title. My object in writing the book was to do good, not evil, and to get some reward for the time thus spent, if not in dollars and cents, then in thanks from those who take my advice and are benefited by it, and I do not ask Mr. Wooster or any other reader of AMERICAN GARDENING to take the advice given, unless they think best to do so. I only tell that which I have found for the past 20 years or more is best for myself.

Mr. Wooster says in his comments on my methods, that it is a lamentable fact that 99 per cent. of all prominent strawberry growers in the United States who have been at the business for more than a quarter of a century, alive to all the improved methods, do not know any more to-day than he does, or any more than they all did 25 years ago, and it is a shame that this new monarch of New Jersey (such a little state) should put them all in the shade. If Mr. Wooster, of Maine, is correct, that all growers (except myself) have learned nothing in the past 25 years, it is certainly lamentable, and in that event I would advise the other 99 to go at something that they could understand. If I could not learn all about strawberry growing in three years, then my friends would be justified in placing me in a lunatic asylum as a useless member of society.

Mr. Wooster is also afraid that I will not make my promise good, and warns all readers to watch this new king that declares himself king of all strawberry growers in the United States. I never know any one who had faults who did not suspect others of them.

The one that has been in the business for 20 years or more and then publishes broadcast to the world what he does know about the business would not make near as large a book as that which he did not know, does harm to the public by keeping others out of a business in which nine times in ten they would succeed, if it were not for the fear that they could not learn it in 20 years or more. Such a one does more harm than the one that tells the public that it is a very simple matter to learn, that there is nothing complicated about it: that anyone with ordinary common sense could learn all about it in much less time than it takes the merchant, mechanic, tailor, or any other business man to master his special line.

H. JEROLAMAN.

## The Bee Keeper.

We have the following from a reader of AMERICAN GARDENING referring to a recent article: "Your beekeeper resumes: (page 796.)

(1) "A strong colony of vigorous bees." How is the novice to know if a colony is vigorous?

(2) "A prolific queen." How is the novice to know when he has a prolific queen?

(3) "A plentiful supply of good food." How is the novice to know that his hive has a plentiful supply of good food?

(4) "A good hive." How is the novice to know what constitutes a good hive?

Now for the replies:

(1) When the last honey flow of the season ceases, which in most parts of the Eastern and Middle states is with the Aster or "Iron weed" in October, the colony should well cover eight combs, 3,200 square inches of the ordinary L frames, while the weather is yet warm. With colder weather the bees naturally will cluster and leave some combs not covered. So novice must take that into consideration. So much for the "strong."

The "vigorous" is not so easily measured or determined. Bees that hatch during the summer months will wear themselves out by fall, and if the breeding is not kept up at a reasonable rate until fall, we must go into winter quarters with a great many nearly worn-out bees; these will die off very rapidly by midwinter and often our colony will be so depleted by spring as to be helpless. The remedy is a young vigorous queen, and plenty of food not later than the middle of July. Then the colony will naturally breed up into the best condition to withstand the severities of the winter. The bees that hatch out and fully mature while the weather is yet warm enough for them to fly daily, seem to be our best winterers. We cannot have them all just right, but should strive to have as many as possible that will live through the winter and be vigorous for early spring work to give the colony its first start. The first and most important maxim for the beekeeper is: Keep your colonies strong.

(2) We can readily determine which hive has a prolific queen by opening it. If the bees boil out at every corner, the hive is overflowing full; plenty of brood in all stages, nearly half of the combs occupied solidly with brood in a healthy condition. But if you find the hive only partly filled with bees and patches of brood scattered and uneven, your queen is giving way and should be superseded by a young queen. A queen generally wears out in about three years, though I have had queens give me excellent satisfaction for five years, but this is the exception.

(3) Use the scale, weigh the hive and all and deduct hive, combs and bees, or weigh the combs and allow for frame and wax. The strong colony should have not less than 30 pounds; better make it 35, or if very large colony, 40 pounds. The quality of the honey can be determined by tasting it. If it is honey dew or fruit juice it is not good for winter food and should be replaced by syrup made of granulated sugar.

In examining and weighing it is well to remember that sometimes colonies have a great lot of pollen in their combs

and lightly covered with honey and capped. Allowance must be made for this, as pollen should not be consumed by the bees until they start spring brood raising.

(4) This question is answered very differently by different apiarists. There are so many different hives and all have good points, but there is hardly any one hive that has all the good points.

I will promise "Novice" that I will give this question full consideration in an early number of AMERICAN GARDENING.

### December Work for the Bee Keeper.

Now the bees need very little attention. They clustered for cold weather and should not be disturbed. But there is plenty of time for the beekeeper to read up and plan for next season's work. GARDENING AMERICAN will contain weekly instructions and advice in this line. All that will appear will be of a practical, timely nature to enable the reader to use it right among his bees. Any topic you wish to have treated, or any question to be answered will receive due attention if you make your desires known. Have you a neighbor who keeps bees? He should take AMERICAN GARDENING for '98. Get his subscription and earn a liberal premium as offered by the publishers.

L. W. LIGHTY, Pa.

## A Morning Glory Cult.

Miss Eliza Ruhamah Seldmore has written an article on "The Wonderful Morning Glories of Japan," which, with many illustrations, appears in the December Century.

It is hardly known, even to foreign residents in Japan, that that land, which has given us so much of art and beauty, has lately revived the culture of its most remarkable flower, the Asagao, our Morning Glory. For size, beauty, range of color, and illimitable variety there attained, this sunrise flower precedes all others, until its cultivation has become a craze, which is likely to spread to other countries, and—who knows—perhaps there introduce the current Japanese custom of five o'clock-in-the-morning teas and garden parties.

Asagao, the morning flower, is more especially Japan's own blossom than the Chrysanthemum, which, like it, came from China as a primitive sort of weed, afterward to be evolved by Japanese art or magic into a floral wonder of a hundred varying forms.

We who know and grow the Morning Glory as a humble back-yard vine on a string—a vine with leaves like those of the sweet potato, and puny little pink or purple flowers—are as far in the floral darkness as the Chinese, who know it chiefly as a wild thing of fields and hedge rows, the vine of "the little trumpets," or the "dawn flower," that is entangled with briars and bushes for miles along the top of Peking's walls. The old poetry and the old art do not seem to be permeated with it, as in Japan, where the forms of vases, bowls, and cups, the designs and paintings of the greatest masters, repeat the graceful lines of vine and flower, and scores of famous poems celebrate the Asagao in written characters as beautiful to the eye as is their sound to the ear.

The Asagao was brought to Japan

with the Buddhist religion, that particular cult of early rising. Scholars and priests who went over to study the new religion brought back the seeds of many Chinese plants. The tea plant came then, and Elsal brought the seeds of the sacred bo-tree; and Tai Kwan, the Chinese priest at the Obaku Temple in Uji, who may have introduced the flower to Japan, was one of the first to sing of the Asagao in graceful outas, classic poems which scholarly brushes repeat to-day. "Asagao bloom and fade so quickly, only to prepare for the morrow's glory." is Tai Kwan's best-known verse. The glorious colorings of the recently-introduced Japanese Morning Glories have shown us some of the hidden beauties of the race.

### Tennyson's Love for Flowers.

An elaborately illustrated article, "Tennyson and His Friends at Freshwater," by V. C. Scott-O'Connor, appears in the December Century. The author says of the poet:

"Willingly he took no part in the destruction of life. His sympathy with nature led him to mourn over the cutting down of trees, as if they were, like the grove in Dante's 'Inferno,' the abode of his personal friends." and he never would consent to his flowers at Farringford being plucked. "I can very well remember the look on his face," Miss Weld, his niece, tells me, "when he met me, one day, returning from his meadows, with a wheelbarrow full of fading Daffodils, plucked by me with the lavish hand of a child. He gazed at them very sorrowfully, and in gentle words expressed his regret that so much beautiful life had been needlessly sacrificed."

### Rural Free Delivery.

A subject that would stand more discussion than it gets is free delivery by the Post-Office Department in rural districts. It is not impracticable, and the chief questions about it are whether the farmers want it and whether it would be worth what it would cost. There would be some economies in it resulting from the diminution of fourth-class post-offices, and some gains in revenue from an increased postal business. In thousands of districts it would pay very well. The \$10,000,000 or so that might be saved by some wholesome amendments to the law which govern second-class mail matter would pay the deficit on a good deal of rural free delivery.—Harper's Weekly.

### How's This!

We offer One Hundred Dollars reward for any case of Catarrh that cannot be cured by Hall's Catarrh Cure.

F. J. CHENEY & CO., Toledo, O.

We, the undersigned, have known F. J. Cheney for the last 15 years, and believe him perfectly honorable in all business transactions and financially able to carry out any obligations made by their firm.

WEST & TRUAX, Wholesale Druggists, Toledo, O.  
WALDING, KINNAN & MARVIN, Wholesale Druggists, Toledo, O.

Hall's Catarrh Cure is taken internally, acting directly upon the blood and mucous surfaces of the system. Testimonials sent free. Price 75c. per bottle. Sold by all Druggists.

## There is Not a Home in the Land

But calls for a yearly Calendar.

Every family tries to get one or more; generally more.

## There are Calendars and Calendars

Some are good, some bad, most of them indifferent.

## There Will Not be a Calendar Issued for 1898

To exceed in artistic elegance, finish, beauty of designs and effective coloring, the one we to-day offer as a premium to every subscription to AMERICAN GARDENING received before December 31, 1897.

# EVERY SUBSCRIBER IS ENTITLED TO ONE

AND CAN EASILY EARN TWENTY.

OUR magnificent **Rose and Girl 1898** six sheet **Art Calendar**, two months to a sheet, each sheet  $8\frac{1}{2} \times 11\frac{1}{4}$  inches, is superbly lithographed in eleven colors, and printed on hammered paper; the whole tastefully tied with silk bow—undoubtedly a work of art fit for the most elegant home, and as handsome a Calendar as was ever published. Each one of the six designs presents a distinct type of female loveliness and a fresh study in roses, the coloring on each sheet being rendered in harmony with the design. There is not a line of advertising on the Calendars to detract from their value. They will not be sold by us for less than \$1.00 each.

### Description

### Who is Entitled to a Calendar?

**EVERY SUBSCRIBER** renewing before **December 31, 1897**, enclosing Five Cents additional to pay packing and postage.

**EVERY NEW SUBSCRIPTION**—To induce people to test the value of AMERICAN GARDENING we will send the Calendar absolutely free to every name received direct not previously on our mailing list. Remit \$1.00 for A. G. 12 months.

**EVERY ONE** sending us a club of Four 3-month trial subscriptions at twenty-five cents each, will get a Calendar, free as a premium, by return mail.

**EVERY NEW name sent in by an agent.**

NOTE.—We have ordered manufactured for us a large stock of these superb Calendars in the endeavor to have sufficient supply for all demands, but will not guarantee to fill orders after supply is exhausted. Therefore, order yours now.

**Special to Agents** A copy of our Art Calendar to show people will clinch the argument and obtain the subscription. Bona fide Agents will be mailed one copy, securely wrapped, on receipt of only Twenty-five cents (one-fourth its value.) Armed with this superb Calendar we misjudge human nature greatly if any ordinary mortal cannot secure a big list of new subscriptions every day. Every new subscriber you send us gets a Calendar by return mail.

### We Pay Agents

Every new subscription at \$1.00 entitles the agent to **Five of the Wonderful Henry Strawberry Plants**, to be delivered next Spring. Thus 100 new subscriptions would secure agents 500 plants; a possession worthy of your consideration. Every new subscriber taken by agent will receive one of our Art Calendars free by return mail.

Agents who do not want the Henry Strawberry Plants can retain as their payment **20 cents in cash** on each subscription they take, or will be credited **twenty-five cents** on any book, magazine or publication they wish to obtain through us.

Address all  
correspondence

**AMERICAN GARDENING, P. O. Box 1697, New York.**

REMIT BY P. O. or EXPRESS MONEY ORDER—IT IS SAFEST.

## The Poultry Yard.

### Mash for Laying Eggs.

The proper composition of a mash for winter layers seems to be a matter of much concern to nearly every poultry raiser at first. Indeed, this is as it should be, for upon this mash depends quite largely the supply of eggs. A very good mixture consists of equal parts of bran, middlings, corn meal, and meat, with half a part of ground oats. Five or six quarts of this will furnish a sufficient breakfast for 100 hens, but it will be better to replace a portion of it with clover or potatoes as often as is convenient. The mash is to be cooked, or at least scalded. It is well to avoid feeding it hot. Any wide departure from natural conditions is quite sure to bring trouble, and Nature does not give hot feeds to fowls. Roup, or the colds which are its precursor, may follow the use of too hot mashes.

### When to Feed.

There is frequent controversy between feeders as to the best time to feed the mash. An occasional one is found who uses it three times a day. The majority, however, give a soft feed but once a day, and usually in the morning. A few advocate feeding it at noon, urging that it tends to make the birds lazy if fed at the first meal. Against this, it is contended that the soft feed enters the system sooner than hard grain, and that this is what is needed most during the cold of early morning, and after a long night of fasting. A small amount of grain, scattered widely an hour or two after breakfast will furnish exercise for several hours.

### Great Poultry Show.

The National Fanciers' Association, of Chicago, will hold their second annual show, January 24 to 29th at the Second Regiment Armory Hall, on Michigan avenue, Chicago, Ill. The importance of this show is sufficient to secure excursion rates over the railroads, and any one desirous of attending can arrange for cheap transportation by addressing the secretary, W. W. Hogle, 1015 Benson avenue, Evanston, Ill. Elaborate preparations are being made and there is no doubt but what it will be the best show of the season in the central west.

### Eggs Broken Internally.

Young hens often have difficulty in laying their first eggs, and not a few birds are lost at this time. A little warmed oil poured into the egg duct may sometimes help a case like this, and perhaps save a valuable hen. Sometimes a soft-shelled egg may be brought forth in this way, also. Older hens, however, often have the misfortune to break eggs internally soon after they leave the egg-cluster. Such eggs may remain within the body, a source of inflammation, for months. The bird ceases to lay, sometimes gets heavy even to dragging, but is useless forever after. If it is suspected that a hen does not lay, effort should be made to prove it, or at least to find out the truth. The non-layer is the non-payer!

### Bemedy for Colds.

Some one recommends the dilution of the contents of a certain bottle of patent chicken medicine in a quart of water, to which is to be added a tea-

Simple, Perfect, Self-Regulating. Thousands in successful operation. Lowest priced first-class hatcher made. GEO. H. STAHL, 114 to 122 S. 6th St., Quincy, Ill.

## Raise Hens

People living just outside cities and large towns can (owing to their nearness to markets,) make large profits in the poultry business. No other occupation pays better or is easier to conduct. It can be successfully carried on by women or boys and girls, provided they have a knowledge of the right methods of management, feeding, etc. This may easily be gained by faithful study of that best and most practical poultry paper,

## Farm-Poultry

It teaches how to make money raising poultry and eggs for market. It is edited by practical poultry raisers, who tell their readers how to prevent and cure all poultry diseases; bring pullets to early laying maturity; make hens lay when prices are highest; build the best houses and yards; keep poultry free from vermin; hatch strong chickens in incubators; caponize and dress poultry for market.

Published semi-monthly.

Price, \$1.00 a year; 50 cents for six months. Sample copy and a 25c. book, "A Living from Poultry," sent for 12c. in stamps.

I. S. JOHNSON & CO.,  
Custom House St., BOSTON, MASS.

spoonful of carbolic acid. Coloring the drinking water with this mixture is supposed to be all that is necessary to cure an ordinary cold in any bird. With all due respect, we consider that the same benefit would probably be received from properly diluted carbolic acid, without the more costly bottled medicine. There are few diseases of fowls that cannot be helped by the use of a disinfectant in the drinking water. M. V. NORRIS.

**The Window Garden.****The Hyacinth.**

Fresh literature on the Hyacinth is actually becoming scarce. If we except the sort of stuff sometimes called literature, which appears in sheets gotten out mainly for advertising purposes. This is plentiful enough, and consists largely of adjectives, coupled with the guesses at cultivation of a new lot of crude writers who crop up every year to tell what they do not know.

The real lack of new literature is not at all surprising, however, if we consider the fact that it is nearly 200 years since the Hyacinth took a leading place as a florist's flower, and that new varieties are not common, so that there is really almost nothing new to be said. Some, therefore, say nothing, thinking that every one knows all that is to be known about this very popular flower. But the new people coming to take interest in growing flowers and the new generations coming forward upon the stage demand for themselves the same information which their predecessors have, in their time, demanded.

So few people know of the delightful Roman Hyacinth, even though it is forced every year, not by the thousand merely, but by the million! Its cheapness, its grace, its profusion, its earliness make it just the one flower to meet the December needs of the great mass of window gardeners, and it is a crying pity that, with all our efforts, we find it so nearly impossible to get before those who would

be so helped by it the information which they need. The great trouble seems to be that the majority of people look upon a horticultural paper as a luxury, and therefore to be gone without. A "luxury," indeed, they find it, but a necessary one, when they once discover that it gives them just the help they have been wanting so long.

The White Roman is the advance guard in the Hyacinth army. After it come its nearest relatives, the colored Romans; the miniature Dutch sorts, and the hand some large-trussed double and single varieties which, to most people, stand for the name of Hyacinth.

The early Romans are the easiest to handle, partly because they are single, partly because they will stand more heat and variation in conditions without injury. Beginners are almost sure to want to grow the heavy double sorts above all others, and their difficulties may very largely be laid to this desire. Coupled with this is the fact that they have not patience enough to wait till the bulbs are properly rooted, and floral writers who sympathize with their haste tell them that three weeks will do for the rooting period if they don't want to wait longer. But it is the very doubles which they insisted on having which need the longest rooting period, because the spike is so much thicker that it needs more force below it in order to get it pushed through the neck of the bulb. Novices who have been disgusted by having their precious Hyacinths stay snubbed down to the earth just above and at the surface, wasting their bloom where it could give no pleasure, should give their minds for a short time to the study of this principle: The whole secret of success in the pot culture of Hyacinths consists in getting the bulbs well-rooted and established in the pots at a low temperature before beginning to force the tops. They will not become well rooted in less than six weeks to two months, the latter period being much the better. How foolish, then, to wait till late to order, the bulbs meanwhile losing strength, and then try to hurry them into bloom without roots to support and feed the tops and blossoms!

The miniature Hyacinths are very pleasing, and give heavier spikes than do the Romans. Considerable time can be gained with the larger sorts, by selecting early varieties, some of which are among the best. Cockade Hyacinths and Grape Hyacinths give variety. The latter do not really belong to the genus, but are cousins to the Hyacinth.

Also allied to the Hyacinth are the Lilliums, the Fritillarias, the Tulips, the Scillas, the Alliums, and the Ornithogalums. For second forcing, the members of the Lily family are not worth much; those of the Amaryllis family are still less valuable, while only the class known as "Cape bulbs" are worthy the trouble of keeping over and re-potting.

The coloring of Hyacinths is remarkable, for among them we find all shades of red and blue except one or two of the most brilliant, with about every shade of yellow, and a wonderful variety of shadings of color on white. One sort is advertised as giving twelve spikes to the bulb. I have no personal confirmation of this supposed fact, which is marvelous among the large sorts. M. V. NORRIS.

Publishers AMERICAN GARDENING:

Gentlemen—It may interest you to learn that my advertisement in your paper brought me customers from Mexico, New Zealand, Canada, New Brunswick and Manitoba, as well as from our own country.

F. L. WRIGHT, Mich.

November 19, 1897.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere

## PRIVATE GARDENERS.

### Appointments and Doings.

Gardeners and others knowing of recent appointments and movings are requested to forward particulars of the same for publication in this column. No charge is made.

Thos. Garrett, late of the firm of Garrett & Rose, Jersey City, N. J., has accepted the position of Orchid grower for G. Schlegel, Bay Ridge, N. Y.

John Doughty, until lately head gardener for Mr. Theo. Sidwell, Shohola, Pa., has been engaged in a similar capacity by Mr. J. E. Habinger, Elm street, New Haven, Conn.

Mr. W. E. Griswold, of Bellows Falls, Vt., sends us a photograph of his greenhouse, showing a collection of bush Chrysanthemums and general florist stock.

The Ladies' Home Journal will publish a new and large portrait of Mrs. McKinley, taken a few days ago in the White House conservatory. This is the second photograph which the President's wife has allowed to be taken within ten years.

### The Water Garden.

CHANGE OF PRICE.—On and after January 1, 1898, the price of "The Water Garden" will be Two Dollars, regardless as to whether the purchaser is or is not a subscriber to this paper. Readers are requested to note this change in the "Catalogue of Horticultural Books" they have recently received from us.

### Business Cards.

C. D. Zimmerman, Buffalo, N. Y. Horticulturist  
Landscape Gardener. Plans and estimates furnished

LAND DEVELOPMENT, consultations, plans, superintendence, plants, labor, etc., supplied for work as wanted. 500 original designs for residences, gardens, parks, etc., ready for inspection. Communications solicited from those who require the value of land or residence developed with practical economy. Jos. Forsyth Johnson, P. O. Box 1697, New York City.

## DO YOU NEED WATCHING?

Or, to put it another way,

### Do You Need a Watch?

We sell them, sell them at such an exceedingly low price that you can't afford to go watchless.

Got 'em all sizes and styles.

But we'll just mention two:

An Elgin or Waltham Watch, best movement made, hunting case, accurate time-keeper, handsomely engraved, Bueber Case, heavily gold-plated—last for all time. Ladies' or gentleman's size.

We'll send it to your address with privilege of examination. If it's not entirely as represented, send it back—costs you nothing. If you like it, pay the agent express charges and \$6.50. That's fair. Or this:

A Hunting Case Watch—beautifully engraved case, first-class movement, any size, heavily plated (14k)—looks just like a \$40.00 gold watch—keeps as good time as any of them. Sent to your express agent with privilege of examination—same conditions as all our watches sent out—and if you like it, pay him \$8.45 and express charges.

If you take our word for it, and send money with order, a handsome chain goes with either, and express charges are paid by us, for the prices named above.

Royal Manufacturing Co.

334 Dearborn St., CHICAGO.

## Greensborough, Ga.

The annual Chrysanthemum exhibit of Greensborough, Georgia, Floral Club, November 3-5, was the finest in the history of the Club. The plants were mostly grown in open ground, and the season was unfavorable, having numerous droughts. The cut blooms were exquisite, however. There were only a few pot-grown plants, and not many grown to single stem.

## New York.

The regular meeting of the Gardeners' Society was held Saturday, December 11, twenty-five members in attendance. A. Piper, 174th street, exhibited a well-fruited plant of an orange which, it was claimed, fruits more readily and makes quicker growth than the Othabete orange. A certificate was awarded. J. I. Donlan reported that a silver cup for the most ornamental exhibit in the recent exhibition at the Waldorf-Astoria had been awarded to C. Knight, Glen Cove, L. I. The treasurer read his report for the year which showed that the Society has just managed to keep a balance on the right side. The following officers were elected: President, W. Scott, gardener to T. C. Eastman, Tarrytown, N. Y.; vice-president, A. Taaffe, gardener to T. O. Matthelson, Irvington, N. Y.; treasurer, Robert Angus, gardener to Major R. E. Hopkins, Tarrytown; secretary, Wm. Bartholomae, gardener to W. B. Isham, Riverdale, New York City; Executive Committee, R. Brett, F. R. Pierkovsky, W. Anderson, John Shore, G. B. Winslade, C. Webber, W. Sage, and A. J. Wengerter.

Wm. Watt, gardener to Col. de Grau, Jamaica, L. I.; R. Whyte, gardener to C. Graef, Tarrytown, N. Y., and C. Knight, gardener to E. R. Ladew, were elected to active membership.

A. L. Marshall, Pawling, N. Y., exhibited three Cannas all seedlings from Columbia; they give evidence of merit. J. I. Donlan and Jessie H. Marshall are the names given to two of them; the other is not yet named.

Robert Laurie, gardener to Cornelius Vanderbilt, Newport, R. I., exhibited six plants of Begonia incarnata, and two of B. socatrana before the horticultural section of the American Institute, Tuesday, December 14, for which he was awarded the diploma of the American Institute. The plants of Incarnata displayed evidence of unusual cultural skill. Mr. Laurie claims that he has an improved form of this old but charming and most useful Begonia, and he names it "Improved." Certain it is that the plants submitted showed considerable improvement both in size of individual bloom and in color. The committee was not able to agree upon the permanency of these improvements, thinking that the growers' high cultivation had much to do with it. This exhibit was much admired and certainly was a grand showing.

## Roses Under Glass.

Growers are now in the throes of the worst time of the year—dark days combined with extremely bad weather. In central New York we have had only one bright day, with two or three peeps of

the sun in three or four weeks. The temperature, too, has been very trying, with lots of cold rains. Syringing has to be almost abandoned, thus giving red spider a chance to put in an appearance. I have found it very practicable, instead of syringing a whole house during these times to go over one bench each day or so—those that are most likely to be infested with spider—and the corners. By doing this the plants dry off much quicker than if the whole house is syringed at one and the same time, and but very little harm, if any, is experienced. On no account should red spider be allowed to get the upper hand; I would rather take my chances with anything else than let this pest once get a strong foothold.

It seems hardly necessary for me to make any remarks on watering, as in previous notes the subject has been well nigh exhausted. Still circumstances alter cases and I would advise not to wait for a bright day on which to do much of this work. Rather keep the beds well looked after in this respect without regard to the weather, and when a favorable day does come, we will be able to center our whole energy on syringing. Now especially, syringing should be done as quickly as possible, and as early as the temperature will permit, thereby giving the plants the best possible chance to dry off by nightfall. Where a man has rather an extensive territory to cover with this work, he will lose much valuable time if he has to water all at the same time. Despite the exercise of the greatest care in this work as well as syringing, in such miserable weather a petal or two on some of the best blooms will get spotted, and if allowed to remain the entire flower will be spoiled. This is often the case with American Beauty, but it takes only a short time to go through a house and pick over what few there are. It pays.

Cold weather will shortly set in; then we will be more on the safe side in using water as well as stimulants, as the atmosphere in the houses will then be working with more freedom atoning to a great degree for the lack of sunshine.

The chrysanthemum has most probably taken a good deal of our time lately, making us liable to neglect some of the current work in the rose houses. The holidays will soon be here, and good roses will unquestionably be in demand at good prices. To get good blooms on straight stems it is very essential that the plants be kept tied up, and last but not least, disbudded. I think this latter operation is not given the attention by many that it deserves. There are a few who think it a sin to cut off side buds because such growers believe they are out so many flowers. In one sense they are, and this opinion may suit these who have no competition and whose customers don't know what a good bloom is or ought to be; but when the latter knowledge is abroad, the advantage of disbudding will not only very soon become a matter of much consequence, but an item that will receive constant attention. By disbudding, larger and finer quality blooms are obtained, and at the same time a large amount of strength is diverted to other channels, obviating to a great extent the excessive drain on the plant producing so many flowers to the shoot.

In some instances the crown or center bud of such varieties as Perle and Meteor at this season become a little malformed or bullnosed, in which case they should be pinched out, leaving the most promising side bud.

# WHOLESALE MARKET REPORT.

## New York.

Cut flowers of high grade have advanced in value fully 50 per cent. Roses of special quality are very scarce. This class Bride, Bridesmaid, Meteor, and Carnot make from \$8 to \$15 per 100. American Beauty specials now make \$5 per dozen. Carnations are meeting with steady sale at price ranging from \$2 to \$6 per 100. Violets range from \$1 to \$1.75 per 100. Roses and Carnations are likely to be in light supply for Christmas; Violets, on the other hand, will be abundant.

Orchids are selling well; Cattleya and Dendrobium formosum are making from 30c. to 50c. per bloom. Cypripedium insignis and others meet with slow sales at \$10 and \$12 per 100. Valley keeps steady at \$3 and \$4 per 100. Lilies and other such stock move a little better.

Christmas green now forms one of the most interesting topics of the day, but to all appearances country collectors are not making much for their labor. Holly is selling very cheap. The market is very full and quality good. Bouquet green made up in roping sells for \$4 and \$6 per 100 yards. There is but little loose stock on hand, and dealers are trying to get 7c. per pound, owing to the readiness with which this has sold. Collectors have been tempted to send in the trailing Lycopodium, but it meets with no sale.

Imported Mistletoe has met with a serious setback, 225 cases, the entire shipment per the S. S. St. Louis arriving Saturday late, was entirely destroyed through heating in the ship, although it had been placed in No. 3 beef house, which was supposed to be equal to cold storage; not a single case was saved. A similar quantity had arrived the previous week in excellent condition; what little of this that was left advanced to fabulous prices. A further shipment is

expected to arrive on Monday by the White Star liner. Despite the scarcity of the imported article, Southern Mistletoe did not improve in value. New York will not use it. Laurel roping is offered at \$2 per 100 yards and sells slowly.

Export trade is evidently booming. Quite a large proportion of the cargo on the S. S. St. Louis sailing on Wednesday, was made up of fruit, mainly apples. There were more than 1,000 boxes containing one bushel each of Newtown Pippins, each apple wrapped in soft paper. The majority of these came from Watsonville, Cal. There was a large number of barrels mostly Winesaps and Albemarle Pippins. There was a vent hole in each barrel to admit air, and the boxes were not made tight either. The goods were put into the forward rooms of the ship.

The general condition of market trade is good and the prospect for Christmas is bright.

The dull weather at this time is not favorable for the production of first-class lettuce, cucumbers or tomatoes. Mushrooms are abundant and falling in price.

Apples—Albermarle Pippin, Va., poor to fair, \$2@3; good to fancy, \$4@6; Winesap, Va., poor to fair, \$2@2.50; good to fancy, \$3@4; Johnson's Winter, Va., poor to fair, \$2@2.50; good to fancy, \$3@4; King, State, poor to fair, \$2@2.50; good to fancy, \$3@3.50; Ben Davis, Western, poor to fair, \$2@2.50; good to fancy, \$2.75@3.50; Greening, State, poor to fair, \$2@2.50; good to fancy, \$3@3.75; Baldwin, State, poor to fair, \$1.75@2.50; good to fancy, \$2.75@3.25; N. Spy, State, poor to fair, \$1.75@2.25; good to fancy, \$2.50@4; mixed lots, poor to fair, \$1.50@2; good to fancy, \$2.25@3.

Pears—Beurré Bosc, per barrel, \$2@3, Lawrence, per barrel, \$1.50@2.50; Beurré Clairgeau, per barrel, \$2@2.50; Beurré d'Anjou, per barrel, \$1.75@2.50; Vicar, per barrel, \$1.25@1.75.

Grapes—Catawba, fancy, per small basket, 10c.; Catawba, ordinary, per small basket, 7@9c.; Concord, per small basket, 7@9c.; Concord, in trays, per 100 pounds, \$1.25@1.75; Catawba, in trays, per 100 pounds, \$1@1.50.

Oranges, etc.—Florida, fancy, bright, best sizes, per box, \$3.75@4; straight lines, per box, \$3.25@3.50; russett, fair to choice, per box, \$3@3.25; rough and coarse, per box, \$2.50@2.75; grape fruit, bright, per box, \$5@7; mandarins, per box, \$4@6; tangerines, per box, \$7@10.

Nuts—Hickory nuts quiet; freely offered at \$1@1.50 per bushel of 50 pounds; bull nuts quoted 50@65c.

Brussels sprouts—Per quart, 4@7c. Cauliflowers—Choice to fancy, per barrel, \$3@5; fair to good, per barrel, \$2@2.50; culls, per barrel, \$1.

Celery—Choice, per dozen, 25@30c.; fair to prime, per dozen, 15@20c.; small, per dozen, 8@12c.

Cabbages—Jersey and Long Island, per 100, \$3@3.50; State, per 100, \$2.50@3.

Cucumbers—Florida, per acre, \$1@1.50.

Chicory—N. O., per barrel, \$3@4.

Egg plants—Florida, per barrel \$5@6; Florida, per box, \$2.50@3.

Green peas—Charleston, per basket, \$1.50@2.50.

Lettuce—New Orleans, per barrel, \$2.50@4; Florida, per basket, 75c.@\$2; Charleston, per bushel basket, 75c.@\$1.25.

Onions—Orange Co., red, prime, per bag, \$1.75@2.25; Orange Co., yellow, per bag, \$1.50@2; Orange Co., white, per bag, \$1.50@3.50; Orange Co., inferior, per bag, \$1@1.25; State and western, yellow, flat hoops, \$1.25@1.75; eastern, white, per barrel, \$2.50@5; eastern, red, per barrel, \$2.25@2.75; eastern, yellow, per barrel, \$2@2.25.

Okra—Florida, per carrier, \$1@2.

Peppers—Florida, per carrier, \$1.50@2.25.

Radishes—Norfolk, per 100 bunches, 60@75c.

String beans—Florida, round, wax, per basket, \$1.50@2; Florida, round, wax, per crate, \$1.50@2.25; Florida, flat, wax, per basket, \$1@2.50; Florida, flat wax, per crate, \$1@2.25; Florida, green, per basket, \$1.50@2.50; Florida, green, per crate, \$1@2.50.

Spinach—Norfolk, per barrel, \$1.25@1.50; Baltimore, per barrel, 75c.@\$1.

Tomatoes—Florida, prime, per carrier, \$2@2.25; Florida, fair to good, carrier, \$1.50@1.75.

Turnips—Russia Can., car lots, per barrel, 60@90c.

Cucumbers, per dozen, 50@90c.

Mushrooms, per pound, 25@40c.

Tomatoes—Per pound, 10@25c.

Lettuce—Choice to fancy, per dozen, 40@60c.

The outlook.—Indications point to an ample supply of turkeys for the holidays. Invoices are increasing rapidly, and while there will undoubtedly be a good demand for choice to fancy stock, moderate prices are generally expected, most receivers not looking for more than 12@13c. for average run of best western. There does not appear to be much hope for any material improvement in fowls and chickens until after the holidays. Fancy ducks and geese will sell fairly, but ducks expected to be plenty and prices moderate, while ordinary geese will not be wanted.

Turkeys—Jersey and up-river, fancy, per pound, 14@15c.; Maryland and Delaware, fancy, 14@15c.; Maryland and Delaware, good to prime, 12@13c.; State and Penn., fancy, per pound, 12½@13c.; State and Penn., good to prime, 11@12c.; western, fancy, per pound, 12@12½c.; western, good to prime, per pound, 10@11c.; western, poor to fair, per pound, 6@9c.

Spring chickens—Philadelphia, fancy, per pound, 11@13c.; Philadelphia, fair to good, 8@9½c.; Jersey, prime, per pound, 9@9½c.; State and Penn., good to prime, 8@8½c.; western, dry-picked, prime, per pound, 7½@8c.; western, scalded, prime, 7½c.; western, fair to good, per pound, 6@7c.; western, inferior, 4@5c.

Fowls—State and Penn., good to prime, 7@7½c.; western, prime, 7c.; western, fair to good, per pound, 6@6½c.; western, inferior, 4@5c.

Ducks—Near-by, fancy, per pound, 9@10c.; western, fancy, per pound, 8c.; western, poor to good, per pound, 4@7c.

Geese—Maryland, prime, per pound, 9@10c.; western, prime, 8c.; western, poor to good, per pound, 4@7c.

Squabs—Choice, large white, per dozen, \$2@2.25.

## Philadelphia.

This market has cleaned up very well during the past week; prices are firmer under light receipts of many things.

Hothouse grapes are not in good demand, 50c. to 60c. being the best price for home-grown stock.

Hothouse tomatoes are moving fairly well at 20c. to 25c. per pound.

Good stock mushrooms sell well at 50c. to 60c.; but most of the stock coming in is poor and off color.

Receipts of apples have been light and prices keep firm. Kings, choice, per barrel, \$3.50@4; Winesaps, choice, per barrel, \$3.50@3.75; do. fair to good, \$2.50@3; Ben Davis, choice, per barrel, \$3@3.25; do. fair to good, \$2@2.50; Rome Beauty, choice, per barrel, \$3.50@3.75; do. fair to good, \$2.25@3; Greenings, choice, per barrel, \$3.25@3.75; do. fair to good, \$2@2.50; Baldwin and Spy, choice, per barrel, \$3@3.50; do. fair to good, \$2@2.50; mixed varieties, choice, per barrel, \$3@3.25; do. fair to good, \$2@2.25.

Pears—Beurré Bosc, per barrel, \$2.50@3.50; Beurré Clairgeau, per barrel, \$2@2.50.

Grapes—Catawba, per 5-pound basket, 7@8c.; Concord, per 5-pound basket, 6@8c.

Brussels sprouts—Per quart, 5@10c. Cauliflower—Choice, per barrel, \$2@3; fair to good, \$1.50@1.75.

Cabbage—No. 1, per 100, \$2.50@3; No. 2, per 100, \$1.75@2.

Cucumbers—Florida, per crate, \$1@1.50. Egg plant, Florida, per box, \$2@2.50.

Established 44 Years.

# OUR CLUB LIST

LET US FILL YOUR ORDERS FOR 1898.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

Address all  
Orders to

AMERICAN GARDENING, P. O. Box 1697, New York.

Lettuce—Southern, per barrel, \$2.50@3; per basket, \$1.75@2.25.  
Onions of choice stock have been scarce with good demand; choice white, per barrel, \$3.50@4.50; choice yellow, \$2@2.50; fair to good, per barrel, \$1.50@1.75; choice yellow, per bushel, 75@80c.; fair to good, 60@70c.  
Radishes—Norfolk, per 100 bunches, \$1@1.50.  
String beans—Florida, wax, per basket, \$1@1.50; Florida, green, per basket, \$1@1.75; Charleston, green, per basket, \$1.25@2.  
Spinach—Norfolk, per barrel, \$1.50@2.  
Tomatoes—Florida, per carrier, \$2@3.  
Potatoes, choice stock, have been in good demand, and selling in carload lots at 75@80c. per bushel; fair to good, 65@70c. per bushel. Jersey sweets, per basket, 50@55c.; Southern sweets, per basket, 30@40c.

## Boston.

Cranberries higher; fancy stock bringing \$7 at the beginning of the week, and a little bit scarce; crates \$2@2.25.

The apple market is in good shape for anything that is fancy; there is plenty of common stock, telling too truly that the farmers had an idea that there were no apples and that everything would go; a few fancy Nova Scotia Kings placed on Monday at \$6 a barrel; Talman Sweets are wanted \$3@4 a barrel; fancy Ben Davis, high color and good size, \$3@3.25; a choice Baldwin worth \$3.25@3.50; few fancy packed New Hampshire Baldwins bringing \$4; Greenings could be quoted \$2.50@3.50. Readers must keep in mind these prices are for the quality that in other years was known as "choice No. 1." the "off" qualities offered on the market are bringing prices "off from these figures."

Egg plants \$3 a dozen; Virginia sweets \$2.50@3 a barrel; Jersey \$3.25@3.50; not quite as scarce as last week. Spinach 30@40c. a bushel.

Fancy cucumbers are in good demand at 8c. each; anything not up in quality sells hard and at low prices. Cauliflower \$2.50@3 for choice; some small bring only \$1@1.25 a dozen; Brussels sprouts 15c. a quart; cabbage in larger supply, bringing 4@5c. each.

Celery is druggish, excepting for the Boston Market, which is not in any too large supply, and easily brings \$1.50@1.75.

Onions having their own way \$2@2.25 a barrel; some home stock brought in early in large round-hooped barrels, realized \$2.50.

Turnips take a range from 75c. to \$1.50. Radishes 25@35c. a dozen. Mint 50@75c. a dozen. Oyster plant 75c. a dozen.

Bourré Bosc pears \$3@3.50 a bushel; some Seckels offered and move at any price buyer will pay, from \$2 to \$2.50 a bushel; Anjous steady at \$2.50.

Leeks 40@50c. a dozen. Parsley unchanged at 75c. a bushel. Artichokes \$1.50. Carrots 75c.@\$1. Parsnips or beets 50@60c. bushel.

Florida green beans selling well at \$3.50@4 a crate; while the wax move slower at \$2.50 a crate.

Lettuce sells hard on account of the smallness of the heads, 30@40c.

York State mushrooms 30@40c. a pound; home-grown 50@60c.

Hothouse tomatoes not quite as high 15@25c. a pound; California four-basket carriers about \$1.50, some trying to get \$2.

Gros Colmar or Alcant hothouse grapes \$1@1.50 a pound; Black Hamburgh 75c.@\$1.

Few Florida pines here of the large variety, 35@60c. each.

Green Mountain potatoes quite firm 80@85c.; Hebrons and White Stars 75c.; red varieties 60@70c. a bushel.

Hubbard squash firm, Western bringing \$25@30 a ton; while nearby fancy stock bringing 2@2½c. a pound. Marrow sells \$1.25@1.50 a barrel; Bay State \$1.25; Turbans \$1.50. The hardest thing perhaps to be found on this market to-day is "choice apples."

# The Henry Strawberry!

**To Meet** The extraordinary demand for this unequalled Strawberry we are preparing 100,000 Henry plants for delivery through next Spring to

## Premium Earners

Henry Strawberry Plants can be obtained solely through a subscription to AMERICAN GARDENING; as the publishers will not sell plants under any consideration;

Neither will Mr. Jerolaman who has signed a contract with us to that effect.

## Who is Entitled to Plants

### NEW SUBS. AND RENEWALS

Five plants of the Henry will be mailed, postpaid, as a premium to every Renewal or New Subscriber sending us \$1.00 for a year's subscription. When remitting be sure to state if you want this premium.

### TO AGENTS AND WORKERS

For every \$1.00 received from agents and present subscribers for New Subscriptions, we mail, postpaid, Ten Henry plants, Five to the New Subscriber and Five to the Agent.

## Special to Club Raisers!

### CLUBS OF TEN

To every agent sending us in a club of Ten New Names and \$10.00 we will forward in payment therefor One Hundred (100) Henry Strawberry Plants, by express, as well as send Five plants, postpaid, to each person in the club.

All orders are now held for Spring Delivery.....

The series of articles on "Big Berries for All," written by Mr. H. Jerolaman for AMERICAN GARDENING, with additions, will soon be in pamphlet form; and agents and friends will be supplied with copies on receipt of stamp. It will be the most unique pamphlet on the Strawberry ever issued.

A Monthly Journal Published at Salisbury, Md.,

By W. F. ALLEN, Jr.

The only paper published **Devoted Exclusively to Small Fruits.**

Small fruit growers can gain more valuable information from one year's subscription to this paper than by reading any book published on the subject at three or four times the cost. THE STRAWBERRY CULTURIST, unlike most other Horticultural and Agricultural Journals, is edited on a farm, by a farmer and a farmer's son, who was brought up at the plow handles and hoeing in the berry fields. Its contributors are of the same stamp, and what they say is practical and not theoretical. It is from experience that they write, which is far more valuable to those seeking information than the words of polished theorists, who, in reality, do not know a cultivator from a hay rake.

SUBSCRIPTION PRICE ONLY 50c. PER YEAR, including 6 plants free by mail of the Marguerite Strawberry illustrated above. Sample copy free.

FIG. 243.—NEPENTHES HOOKERIANA. THE ASIATIC PITCHER PLANT.

(See next page.)

## The Nepenthes.

Among the many curious and beautiful subjects which have come to ornament our greenhouses from tropical Asia there are none more singular nor of more exquisite appearance than the *Nepenthes*, or as they are commonly called, Pitcher plants.

Our front page illustration shows a well-grown plant of *Nepenthes Hookeriana*, which was discovered at Sarawak, a province of Borneo, and not far from the Equator, in the year 1847. N. Lindleyana and N. Loddigesii also were found in Borneo that same year.

Noting the locality from which these gems were collected, it is not to be wondered at that they indulge in high, moist temperatures when under cultivation. The heat necessary for them varies from 60 to 90 degrees, the first named is about the lowest they will stand in the winter months, and to be successful with them they need at all times considerable moisture in the atmosphere.

In our climate *Nepenthes* are comparatively easy to grow under glass and will produce their pitchers much more readily than they do in some European countries where the sun is less powerful.

The plant grows best in a pan or basket depending from the roof. The compost most generally used is fibrous peat, charcoal, potsherds, and sphagnum moss; good drainage is one of the essentials and the dressing of moss prevents evaporation.

If the plants are ever needed for decoration or exhibition a point to remember is that the pitchers will stand all this and give great satisfaction by their wonderful endurance, providing the liquid secretion always found in the bowl naturally is not lost, so that one of the points to guard against is the tipping or spilling of this, otherwise the pitcher soon dies. Propagation is carried on from seed or offsets. A strong moist heat is necessary to germination.

## Concerning Experiment Station Work.

To the Editor of American Gardening.

It is very much to be regretted that we have such outbursts as those from Mr. Rose and Mr. Wright published on page 810 of AMERICAN GARDENING, with regard to the experiment stations.

These men seem to condemn our experiment stations *in toto*; they regard them as nuisances and even compare them with that almost universally condemned humbug, the annual seed distribution! They say that in most cases there is harm done rather than good by the experiment stations' tests, that both time and money are wasted, and that we are given no practical results. Yet they claim that experimental work is all right if mixed with a little common sense!

How many new kinds of strawberry plants, or for that matter, any other plants, did they send to have tested? Did they get unfavorable reports from the station as the results of testing those plants?

The government maintains a station in every state at a big expense; many states have state stations extra, and they are to-day and always have been of inconceivable benefit to the horticultur-

ists as also to the common one-horse farmer; in fact, they show partiality to none, but give actual facts, as they are from trial. A well-conducted station can determine what a new plant is worth by using a one-half dozen as certainly as if there had been a one-half thousand planted; furthermore, station officers are necessarily compelled to test all new things on as small a scale as possible, because hundreds of different tests may have to be made, and hardly any station has more than 15 or 20 acres to use for trial grounds.

Who has taught the orchardist, truck farmer, or general farmer to prevent the depredations of noxious insects, or how to eradicate them entirely? Who has given and published formulæ for the best and most suitable manures in order to save thousands of dollars to those not acquainted with their uses? The experiment stations.

Many a farmer has been helped on the road to success by studying their bulletins, and it is to be regretted that we still have men living who regard their work as comparatively nothing and mere child's play! Who will gainsay the abilities of such men as Profs. Bailey, Atwater, Green, Smart, and many others, who have given their life work for the benefit of the farmer, and who receive comparatively little compensation for their unceasing labors? Who, I say?

Those men in making their "kick" against experiment stations put me in mind of the fellow who believed that "book learning was no good no how;" so they had better experiment for themselves hereafter. It would be a good idea to question these soured gentlemen on experiment station work, by whom it was brought about and determined if this great of greatest industries of making sugar out of sugar beets can be profitably carried on in the United States, East as well as West. That sugar can be made out of beets has long ago been known, but through tests and actual experiments, our various stations have come to the assistance of the farmer and informed him on what kind of land to grow the beets, what kinds of fertilizers to use, how to cultivate and produce beets which would yield the greatest amount of sugar. No one farmer could make these tests, the experiment stations alone could do so. Now see the result: even in New York state, where it was supposed beets would do no good, the sugar beet industry is to-day a success, and no doubt in the course of a few years, every state in the union will have its sugar factories to enrich the farmers, at least those of them that will raise the raw material!

Through whose effort were brought about all the benefits the farmer derives from this new industry? Certainly not through those of men like those mentioned above, but solely and only through the scientific and untiring efforts of our experiment stations. M.

Subscribers will note that the year is rapidly closing. Encourage us in our efforts by sending in your renewals early, also new subscriptions. Tens of thousands would gladly subscribe to AMERICAN GARDENING did they but know of its existence and its great value.

## The Fruit Garden.

As the end of the year draws near and we begin to write for the last number, we find ourselves thinking not of what we are going to do, but of the past year and what work has been accomplished. Has our work benefited anyone? Has it been a case of empty words and self?

To the last I can emphatically answer. No; but a weekly practical routine of worked-out facts, given not as the only right mode, but partly as a questioner after other worker's methods. As to the last idea, it was apparently a failure, or the subjects were too weak to deserve the comment of others; it certainly was not perfect even to the writer.

But if anyone has derived benefit from the weekly message, the main object for its commencement will have been attained. Should any member of the spade wander this way he will find a ready questioner on garden sauce, who with his partner's help, will endeavor to make life bearable for the wanderer.

J. HOLLOWAY, Glen Cove, L. I.

## A Home Rockery.

My rockery pictured in the accompanying sketch, is 20 feet long, 2 feet 6 inches high, and 2 feet 6 inches across the top. It is built of rough cobble stones held together with Portland cement. At the bottom I had well-rotted manure with sandy loam say to 6 inches; my Ferns and Cannas did well.

The rockery filled in a vacant place and was very ornamental and much admired. It is at the north side of the front entrance, covered by the foliage of Chestnut and Maple trees with lattice fence dividing from a tennis lawn belonging to my neighbor, whose house is some hundred feet beyond, and shades from the north wind.

In moving Ferns they should be taken up when the fronds begin to appear; if the operation be delayed they do not do as well. In this section there are a great number of our native Ferns. I find them all to do equally well, and so with other wood plants. If your readers will try a rockery or fernery, they will, as I do, derive a great deal of solid satisfaction and pleasure.

PALMER BURROWS, M. D., Ont.

## Storing Celery.

When reading in your paper of the different ways of keeping celery, I have been tempted to tell my way. Supposing the celery is grown to full size, I cut off all the roots and the useless green stalks, and pack in convenient sized dry goods boxes, alternate layers of celery and sphagnum. The moss must be damp but not soaking wet. I nail up the boxes and pile them up out of doors until decided cold weather, then remove to barn or shed, and keep there until it is no longer safe to do so, and then finally to the cellar.

The essential conditions are damp, but not wet, and as cold as possible without spoiling. I have frequently kept even White Plume until March perfectly.

J. T., Conn.

## Fruit Growing on the Peninsula. Conditions and Prospects.

Few people who have never visited this peninsula, have any idea of its capabilities or possibilities as a fruit and vegetable growing locality. No especial effort is ever made to advertise it, except what is seen from the railway trains, and as a rule, a railroad does not show up a country to its best advantage. At Chicago where our products would have compared with those of any other state, the whole appropriation was gobbled up in a little cottage suitable for the seashore, or to show a few old rags left from the wardrobe of some Revolutionary hero. I never saw finer crops grown here than were produced in 1893, and not a handful could we have for exhibition; so, as previously stated, our products, except Delaware peaches, are but little known and are scarcely celebrated.

Many people speak of the Delaware peach orchards as if that fruit was

man, but our fertilizer bills offset his water tax, or labor bills. Taxes are 50 cents on the \$100 in most of our counties, while they are \$1 or more elsewhere. Farm labor at 75 cents a day, where \$1 is paid North and West, and board given too in many places.

Our yields of crops also compare with other localities. A neighbor of mine got 50 bushels of wheat per acre this year, and yields of 25 to 35 bushels were quite the rule. Around the northern portions of the state yields of 40 bushels were the rule. I have seen fields of 50 and 100 acres of corn in Queen Anne's Co., Md., that would shuck 50 to 75 bushels to the acre right along; and clover that cuts two tons easily.

In the matter of fruits, this section has always been known as the chief source of supply of peaches for New York, Boston, Philadelphia, Baltimore, and the many lesser cities of the Middle and New England states. At one time there were more than 10,000,000 peach trees grow-

the factory. You see these canning factories at nearly every station on the railroad. A large concern at Dover cans beef, ham, poultry, plum pudding, etc., and has a world-wide reputation for its products.

The late Governor Marvil was the pioneer basket and crate manufacturer. I believe he invented the package and made a fortune out of its manufacture. Many towns have similar factories which use up quantities of gum and pine timber for all kinds of shipping packages.

Our towns don't furnish enough pickers in berry season, so tents are erected which hold from eight to twelve people, and families come from the oyster and fish localities after their work there is done; they live in these tents during berry season and help pick. Some growers get pickers from the cities also. Many growers have a store and are able to provide their labor with anything they wish at market price, but do not compel them to deal with them. The butcher's wagon and baker's cart make daily trips to these shanties and often do a lively business. A man sells lemonade, cakes, pies and peanuts in the field and on Saturday has a good pile of checks to be cashed with those of the pickers.

The railroad companies run entire trains of fruit, potatoes, and melons. Thousands of acres of watermelons and cantaloupes are grown and shipped by the train load. The two lower counties of Virginia may be styled one vast potato patch where the main crop is sweet potatoes, the soil being admirably adapted to this crop. I have seen tubers that weigh nine pounds, and I also grew 13 that filled a 5-8 bushel peach basket.

To a traveller in May, there is no prettier sight to look upon than fields after fields of crimson clover. This is made into ensilage, hay, or plowed under for manure. It will grow on any land, rich or poor, but the richer the land the larger the crop. As an improver of worn-out lands it is equal to \$10 to \$12 an acre on any land. Cow peas may follow this crop, giving two crops of green manure the same season, furnishing quantities of nitrogen, that most valuable and expensive element of plant food.

The weather, as a rule, is good, climate mild. To-day (December 11) the mercury stands at 68 degrees in the shade. While the ground has been frozen several times we have had no snow and but few days that outdoor work could not be done. January is about the beginning of winter, and some seasons it extends to March. We often can plow, seed, and do farming operations the last of February.

Nearly every winter we get ice for home use, but there is plenty of artificial ice, so no need to go without it.

Every portion of the peninsula has its advantages and disadvantages. I prefer the southern part of the state of Delaware, because we have both water and railroad transportation, and the promise of another railroad. Our soil is light and easily worked and has good bottom. Our fruits come earlier and sell higher; we have no lack of labor; we are in from three to ten hours of Wilmington, Philadelphia, Baltimore, Washington, New York, Boston, Hartford, Prov-

FIG. 244.—A HOME ROCKERY. (See opposite page.)

our only production, when in fact, there is no fruit, vine, or plant, that will grow in a temperate climate that will not grow here. We have wide-awake men, but hardly enough of them. The fact is crops are so easily produced that a fair living is assured every one, and there often is not that attempt made to secure more than a living as might be under other conditions. I have been in twenty states and seen good and bad farming, but I venture to say as good, neat farms are not often found as may be seen in many sections of Delaware and Maryland.

The county is nearly level, making the use of machinery easy. The country roads often of shell are, as a rule, good. The water courses abound in many kinds of fish, oysters, clams, crabs, and terrapin. Formerly any quantity of game birds abounded, but these have been killed rather closely. Still a good day's sport may often be had.

The soil in some localities is poor, in others good, but responds to, and shows for years the effect of, manures or clover. Nearly every town has a fertilizer factory; this would astonish a Western

ing here. Orchards of 25,000, 50,000 and more trees are not uncommon. More than \$100,000, was the net return for a single crop of peaches to a Maryland grower a few years ago, and the product of a single farm often reaches 150,000 quarts of strawberries, and 100,000 quarts of red raspberries annually.

You can go to many single growers and buy a car of strawberries, peaches, pears, potatoes, as easily as you could wheat or corn in the West, and I have seen 500 pickers at work in a single berry field.

The canning factory in my town claims to handle more peas than any other in the world. Its capacity is 100,000 cans per day, and six big hullers are used to hull them. The peas are grown by contract at 2½ cents per pound. They are either pulled up or cut with a mower, and hauled like hay to the cannery, where they are hulled and canned at once. The grower can have the vines for manure if he wants them.

The same factory later in the season handles peaches, tomatoes, and pears. More than 500 persons are employed in

idence, and in easy reach of all the interior markets of Pennsylvania, New York, and the New England states, the best in the world. No other section is so well situated.

The mean annual temperature is 51 to 53 degrees, with a rainfall of about 50 inches. There are no states in the Union that have so many bearing peach trees as Delaware and Maryland, and the approximate cost of producing them is lower than in any other locality in this country owing to fertile soil and a genial climate.

The state of Maryland produces one-third of the oysters of the world, the value of the product in 1892 being \$5,800,000.

Your correspondent who inquires on page 845, would get more for his money in Southern Delaware where he could grow peaches, which he could not do at Dover. His products would ripen earlier and sell for higher prices. He can bring up the land by means of cow peas, crimson and red clover, and commercial fertilizers and raise good crops at the same time.

I would not plant blackberries, but the Lucretia dewberry pays. For raspberries the Miller is the main variety. I would try some Loudon and the Logan berry is worth a test. Currants are not a paying crop, but gooseberries pay in some sections.

Every one grows more or less strawberries, the leading kinds being Bubach, Tennessee, Crescent, Haverland, Michel's Early, Brandywine, and others.

Of plums I would select some each of natives and Japans. Milton, Whittaker, and Wild Goose being among the best natives; Red June, Abundance, and Burbank the best of the Japans.

Meech and Champion are the best quinces. Kieffer pears have paid, but with the large quantities being planted, I doubt if they will pay in years to come.

Of peaches the Mt. Rose, Lady Ingold, Oldmixon, Foster, Reeves' Favorite, Wheatland, Elberta, Cowper's Late, Crawford's and Chairs' Choice are among the best.

Good winter apples like Stayman, Paragon, Missouri Pippin, Nero, York Imperial, Stark, and Lankford pay handsomely.

Some parties have made good money out of grapes. Sweet potatoes have paid handsomely the past season, and so have round; but a few years back they did not.

When a man is near a creamery he can keep cows at a profit, but if not, only enough for his own use will be found best. There is no better locality for pigs and poultry, and if properly handled both pay good profits. We have first-class schools and good churches in every town and locality.

CHAS. WRIGHT.

The 43d annual meeting of the Western New York Horticultural Society will be held January 26 and 27, 1898, in Rochester, N. Y. Essayists of well-known ability, both scientific and practical, will address the members and an interesting question box is arranged.

## Portable Fence.

In your issue of November 6, I notice a short clipping and cut of a portable garden fence the panels of which are made of four boards and two standards and every second panel has six pieces to brace it. There is so much use for a piece of portable fence on every farm that the matter is of considerable importance but it seems as though the above mentioned style would be very costly. There are very few months in the year but what a piece of portable fence would be used if a practical, reasonably priced affair could be procured. We often need a piece to keep the chicks out of the garden while the seeds are sprouting, to make a sheep pen, to enclose the stacks, to make a pen to turn a lame or sick animal into. In this connection I wish to mention a hurdle or portable fence made by the Page Woven Wire Fence Co. at Adrian, Mich. Each panel is 8 or 10 feet long and 36 to 58 inches high, the panel frame is solid wrought iron and the wires are woven on by hand, making a very handsome affair. No posts are used except a short piece of round iron to be driven into the

FIG. 245.—HANDY SLED RUNNER.

ground for each length, and the panel frames are wedged together by a very simple and easily adjusted wedge. One man can put up 180 feet in an hour. It has given good satisfaction, and I believe it will supply a long-felt need on the farm.

J. H. R., Mich.

## National Experiments in Peach Culture.

The committee which was appointed at the last meeting of the Association of Colleges and Experiment Stations for co-operative work in testing the five races of peaches in United States, and to find out their adaptability to different thermal lines, has agreed upon a plan and is submitting it to 24 different experiment stations and asking them to co-operate in this work. It might be interesting to individuals also to engage in this work. If the experiments prove what they reasonably appear able to do, the question of what varieties to plant in a given latitude will be easily determined. It could be easily predicted then from what races varieties should come which will be adapted to a given latitude. If this can be determined it will be an enormous saving of money to individual growers. They would at once discard all varieties

which come from races which they would know are not adapted to their latitude. Of course, it is expected that humidity will affect results, and therefore modify conclusions as well as latitude.

The following races and seedlings are recommended: Peen-To race: 3 Peen-To, 3 Angel, 3 Waldo. South China race: 3 Honey, 3 Pallas, 3 Early China. Spanish race: 3 Cabler's Indian, 3 Texas, 3 Victoria. North China race: 3 Chinese Chang, 3 Elberta, 3 Mamie Ross. Persian race: 3 Alexander, 3 Mountain Rose, 3 Oldmixon Free.

The following are members of the committee and will look after the experiments in their respective localities: Prof. R. H. Price, Texas; Prof. G. H. Powell, Del.; Prof. E. J. Wicson, Cal., and Prof. L. R. Taft, Mich.

## Handy Sled Runners.

With the advent of winter one waits the snowy mantle over the earth, and when it comes sleighing is in order. To the farmer a wagon on sled runners becomes almost a necessity, and he will be glad

to know he can convert his wheel wagon by using the Handy Sled Runners as illustrated herewith. These are being introduced by the Electric Wheel Co. of Quincy, Ill., and will fit any farm wagon. You can take off your wheels and fit the runners to your wagon in a few minutes, no tool except an ordinary monkey-wrench being required. The runners are also arranged so that one can make an ordinary bobsled if desired. When attached to the farm wagon they will track

with other bobsleds as they are attached to the shoulder of your skains. They are made of wrought steel and will not snap off or break as the ordinary cast iron runners do, particularly in specially cold weather. The standard runners have tires 19-16 inches wide, and 9-16 inches thick.

## Fertilizing Tomatoes.

To the Editor of American Gardening.

It seems evident from recent letters that tomato growers can produce the same results without bees as with them—a stroke of luck I suppose.

Last year I grew Livingston's Perfection, and the whole house during the season did not produce more than 100 pounds of fruit. At the present time I have had 150 pounds already, leaving about five times that amount yet to come on this crop. I account this success to having the bees; last year I did not have them. Was it the weather or the bees or variety grown? Perhaps the critics on tomato growing can explain. On the average, two tomatoes weigh one pound. The Lorillard is my favorite variety.

JOHN FRASER, N. Y.

## THE READERS' CLUB

REPLIES TO THE PROBLEMS IN THE  
QUESTION BOX.

### Are Bees Necessary for Cucumbers?

I have had considerable experience in forcing the English cucumbers and I am quite sure it is not necessary to fertilize the flowers to get fruit; in fact, for market purposes, you will get better shaped fruit without fertilization. Anyone can try the experiment and will find a cucumber that has been fertilized will grow large at the end and small at the stem, which certainly would not improve the looks of the fruit for market. On the other hand, should any one desire to save seed the fruit that is intended for seed must be fertilized.

If we have come to a point where we cannot get good tomatoes without bees, I fear the bees will not improve them much; the structure of a tomato blossom is not very inviting to bees anyway.—Wm. T.

### Fruiting Seedling Grape.

In answer to the question on page 865, about seedling grape, I speak from 15 years' experience as a private gardener. If the seedling of the White Almira grape is five years old, do as I have done. Cut back the vine any time this month or in February, only leaving one or two of the strongest eyes or buds on your two side shoots or branches. Give a good top dressing of rotted manure this month, and spade under in spring. Keep off aphids and mildew in summer with a mixture of sulphur and tobacco dust, applying this mixture with a bellows. You will then have fruit next year and no grafting is necessary. Prune your vines every year and top dress.

Seedlings produce a few bunches the third year if well pruned every year, and by the sixth or seventh year come into their full bearing. If the fruit is not of excellent flavor, I would advise you to graft from a good quality later on.—OTTO TREIBER, gardener for A. Friedlander, Esq.

### Hardiness of Hale Plum.

Regarding the hardiness of the Hale plum in the vicinity of Boston, so far as I know, the first trees of this variety to be planted in that neighborhood were set out last spring, and they never have been wintered in that latitude; but here in central Connecticut, where the climate is fully as trying, they have gone through two winters past without the least injury to the wood, while the fruit buds are more hardy than those of Burbank or Abundance.—J. H. HALE.

### Mushroom Matters.

Replying to Agaricus (page 865) and taking the questions serialim:

(1) Virgin soil is not absolutely indispensable. I have had equally good results from the use of good garden loam, free from stones or decayed wood.

(2) Have invariably found that beds covered with litter give better results than others. Beds made in a dry place, or where subject to any draughts, will do better if kept covered after mushroom

rooms appear. This is not so essential in mushroom houses properly constructed, where proper humidity can be maintained.

(3) My experience coincides with that of your foreman, that pin-heads, while they are virtually small buttons, have no vitality and rarely amount to much, even under best conditions.

(4) Every particle of the prepared manure should be moderately moist, but not wet enough that, by squeezing a handful in the hand, one drop of water should ooze out.

(5) Beds properly made should not be permitted to become dry, by preventing any evaporation of moisture therefrom, by covering as suggested in No. 2. When buttons "get stuck" it may result from insufficient heat and uncongenial moisture at the time of spawning, or by the use of weak or old spawn, which if stored in a very dry place, becomes very dry and hard. I have found it advantageous to keep spawn bricks packed in paper, or in nearly air-tight wooden boxes. Should the beds be dry, water the straw covering on top, sufficient to permit the bed to absorb the moisture. Do this every morning until the bed is fairly moist.

(6) I have had equal success with four beds one above the other, as with on the floor proper. This of course depends upon the position and structure of house. If on the north side of other buildings, or shaded from direct rays of the sun, with double walls and roof, so that an equal degree of moisture permeates the whole house, the tiers can be successfully operated.

(7) We have never noticed that iron was injurious to mushrooms.

(8) In some experiments made some years since, I found the use of one ounce of nitrate of soda per gallon of water, used for watering or syringing, gave better crops, but not perceptibly better than by the use of clean rain water. Either is much better than ordinary well water.

(9) Darkness is not necessary. Enough light to see is permissible.

(10) An average depth of 15 inches.

(11) No, unless they are somewhat decayed. I have frequently mixed these materials with the manure, when such have been used fresh as bedding for horses, and are thus impregnated with ammonia.

(12) I generally use one pound English spawn per three square feet of surface.

(13) This is difficult to answer, so much depends upon circumstances, appliances, markets, and luck. Given suitable conditions they would pay at 80 cents per pound wholesale. When I grew them to sell some years ago I averaged exactly one dollar per pound; the price since has materially decreased. If good markets can be secured at above figure, I would say mushrooms are a profitable crop if reasonable success in growing them is assured.—W. M. EDWARDS.

### The Availability of Liquid Manure.

Liquid manure, if properly diluted, is supposed to be almost immediately available as food for all plants, especially after it has filtered through the earth from the surface to the roots of the plants.—E. W. W., Me.

### Stored Celery.

L. S., page 845, will find his celery will be much better if heeled in when put in trenches. I always keep rain from it after lifting, as I find it is liable to cause it to rot, unless you have room enough so as not to crowd it; then rain would not do any harm, as it would dry out again on fine days.—C., R. I.

### Tuberoses and Winter.

Tuberoses will not stand any frost whatever, neither are they of any service for flowering a second time. It is not worth while trying to cultivate them up to a flowering stage, for they can be purchased so cheaply each season and will give greater satisfaction.

### Pruning California Privet.

To keep a Privet hedge in good order with the least trouble, it should be clipped at least three times during the growing season, while the wood is young and soft. Plants just set out will do better if one-half the last season's growth is cut off.—W. M. E.

In answer to the inquiry of J. E. C., on page 865, I would say that it is likely a considerable portion of the stems will be winter killed, and for that reason I would prefer to leave the pruning until spring time and then cut them off evenly, and low down. They should make strong shoots next season, and these should again be cut back, and sheared to about half their length in July. They will break again, making about six inches of fresh growth. In this way we get a good bushy hedge. July will always be the best month in which to trim Privet hedges.—T. D. H., Mass.

### Propagating Shrubs from Cuttings.

These are propagated in the fall from well-ripened wood of the past year's growth. Make cuttings 6 to 8 inches long, set the cuttings in rows 2 to 3 inches apart, leaving only about one inch of the cutting above ground, pressing the soil compactly against them. When ground freezes mulch with any light material.

Box-wood will do better planted in early spring.—W. M. EDWARDS.

### The Best Grapes.

In answer to A. J. M., page 865, I would remind him that tastes differ, and there is probably no grape, black, red, or white, which all judges that would agree in pronouncing the largest and best flavored. I should say the best black is Campbell Early; the best red Brighton; the best white, Moore's Diamond. I think these are all hardy, but Brighton needs another vine near it to pollinize its flowers, if it is to yield a full crop.—W. H. W., Mass.

### Wintering Cannas.

I have lost all my Cannas for a few years by putting them in the cellar out of the reach of frost; now I put them in pots or anything that will hold them and keep in the conservatory in a growing condition, though watered sparingly. In this way I have plenty of fine plants for spring planting; those I cannot care for this way have gone to the potato bin.—J. A. W.

### Pruning Clematis.

Clematis can be pruned in the spring. I always cut back to 18 to 24 inches, and thin out the weaker growth so as not to have too much vine, and thus produce larger and better flowers. When left to grow at will it becomes too dense, and then covered almost with small blooms not so interesting to the eye, I think, though it is prized by many for the mass of blooms.—W.

### Directions of the Rows.

In planting Sweet Peas the rows should be north and south so the sun can shine on either side and thus produce a symmetrical growth. I have planted rows east and west and then have more trouble in keeping them on the trellis or brush; the north side seems to go more to vine and does not produce as many nor as fine blooms. I think brush the best for peas, as it leaves the tops open and gives a better circulation of air.—W.

### Algae in Lily Pond.

G. N. C. (page 827) is advised to use Bordeaux mixture, one-third less than the usual strength, as applied to other plants, applying with a spray pump or hand syringe. That will destroy the algae.—WM. TRICKER.

### Best Avenue Trees.

Walnut trees are not recommended for avenue planting. With the exception of the nuts dropping in the fall, I know of no objection to Black Walnut for this purpose; it is a majestic tree, healthy, and not troubled with any insects, and will grow in any situation. If it is determined to use it, we would set the trees 35 or 40 feet apart. When transplanted, being very hard wood, they should be severely pruned.

Our choice for this purpose, however, would be either with Scarlet Oak or Maple.—W. M. EDWARDS.

Black Walnut trees (*Juglans regia*), are not suitable for an avenue on a gentleman's well-kept place or driveway. If used, you will always have an unsightly looking avenue after the fruits commence to drop. This tree is best suited as single specimen on the lawn. For an avenue or drive, speaking only of private places, the best tree is *Acer dasycarpum*, Silver Maple. Prune well when transplanted and transplant 15 or 20 feet apart, early in spring or last part of October is best.—OTTO TREIBER, gardener for A. Friedlander, Esq.

I should advise Rockland to plant his avenue with American Elms. They are quick growing, healthy, and comparatively long-lived. There is no tree more graceful. Their winter aspect is beautiful, and this is important when we remember that deciduous trees are leafless for nearly seven months of the year. Their falling leaves give little trouble, and it is seldom they kill the grass about them, as Maples do, by dense shade near the ground.—T. D. H.

### Tomato Eclipse.

Replying to Mr. Stewart Ritchie who inquires (page 861) for seed of Eclipse tomato, I will be glad to forward some to him if he will mail me his full address.

Having grown this variety for over three years, I can confidently recommend it as superior to any other sort I have grown, and I have tested a good many kinds, both English and American during the past few years.—W. N. CRAIG, Taunton, Mass.

### Gloxinias in Winter.

I saw in AMERICAN GARDENING, December 18, 1897, page 865, a question as to the best means of keeping Gloxinias over winter. I am very fond of these plants and I have about 30 pots of them in my bay window. Two I have had a little over 18 years. I seem to have very good success with them.

Firstly, I do not see why Mr. Irish wishes to dry them out in winter; then I do not think they need so much rest as some think. I am always interested in what I see about Gloxinias. We stay in North Carolina winters and in Croton, Ct., summers. We went home last summer, June 4. My Gloxinias were late and all in bloom then. I cut off the tops of a half a dozen so as to be able to take them home for gifts, and as it was a rather rough way of treating them, I thought I would keep and start them myself.

I put them in four-inch pots, part garden soil and leaf mould, June 10, and set them on an outdoor east window shelf, where they had the morning sun, and all the rains (and a great deal of the latter) and were in full bloom by the first of October, and were small not large bulbs; by that I see that they did not need much rest. I never had any do better, and such small bulbs! When we go home to Connecticut I sink the pots in the ground in as shady a place as I have and leave them to take care of themselves. The bulbs are not dried and are in a good condition to start in the fall. I will say further that Gloxinias need lots of sun and lots of water.—MRS. CHARLES MERRITT, N. C.

I had the same trouble as Mr. Irish (page 865) until I allowed my bulbs to stay in the pots they had grown in during the summer. I never let them get dust dry. A little water once a week keeps the roots alive.—T. D. H.

### Wants the Strawberries to Do Better.

W. S. (page 845) is advised as follows: To the old patch: In the spring just as soon as the frost is out of the ground, with a fork dig two alleyways through the patch 18 inches wide (removing the mulch to one side to enable you to do so), shaking the soil all out of the plant roots back into the alleyway. This will give you three matted rows about 20 inches wide, from which all the mulch then should be drawn into the alleyways. Over these rows sow when plants are dry, and follow with a brush to clean the foliage, about 50 pounds of commercial fertilizer that contains about 10 per cent. of potash and phosphoric acid; nitrogen not absolutely necessary in this case, as the mulch will furnish an abundance of that. A shaking over these beds of fine straw, if the season should prove to be a dry one, will give more berries and lengthen the fruiting season.

In a cellar at 50 degrees in the light, strawberry plants would continue to

make a slow growth and be more than likely to send up fruit buds before spring. This would do no harm to those plants that were to be set for plant-making, if these buds were nipped as soon as they appeared; as the plants would be growing stronger all winter, and in such sized pots there would be no danger of their root-binding; but as this cellar growth would be tender, they should be gradually hardened off in the spring, while in the pots, by being set in the open air sun during the day, before being set in the open ground.

The plants to fruit should be gradually frozen, soil and all, and placed in the coolest and darkest part of the cellar where they will remain frozen till the frost is out of the open ground, when they should be taken to the open air a few days before being set in their final resting place.

The plants to grow plants from should be treated as follows: Spread on the ground fine manure four inches deep as soon in the spring as it is in good condition to work, and plow this under 6 to 8 inches deep; set your plants without disturbing their roots much, in a row, three feet apart, giving them plenty of room on either side to spread; for in a favorable season, if strong-growing varieties, under the culture I here advise, they are likely to spread one rod wide. Before setting the plants, however, the ground should be worked up fine with a fine-tooth cultivator to a depth of four inches, and the surface spread an inch deep with well-decomposed, fine cow manure. The cultivator should be kept going often, so that no crust can form or weeds start. The first three or four plants that form should be trained along the row so as to fill up space between the plants, after which they should be encouraged to reach out and make plants from 4 to 6 inches apart all over the ground they are going to occupy. The weather should be dry the plants should be assisted to take root by putting a little earth over the joints of the runners, and frequently watering.

The plants to fruit should be set one foot apart in a row on ground prepared as above, and after being set, a small handful of, phosphate, the kind as mentioned here, placed around each plant, and over this a good mulch of straw or any other good substitute for it. No runners should be allowed to grow till after they have fruited; then the mulch should be removed and cultivation begin. The first four plants formed should be trained, two on either side from the row from each plant, and about one foot from the plant. Set these plants close together and keep all other runners out.—E. W. WOOSTER, Me.

Deepen and enrich the soil with well-rotted stable manure or a compost containing a large quantity of humus. Matted rows give the largest quantity of fruit, but it is inferior in size to the single plant system. Allow one square foot of surface to each plant, but two cubic feet for the root system of each plant. The largest berries are produced the first year of fruiting. But the second crop will give a quantity that exceeds the matted row at its best. If the soil is in the best condition, top dressing is of little value; usually all runners must be kept off of fruiting plants.—H. SNYDER.

**Wants to Grow Strawberries.**

I understand that J. M. Cushman, page 845, wants this acre to fruit in the summer of 1900, and is not particular about its fruiting, or a part of it, before that time. If, however, he wishes to set some in the fall of '98 to fruit the following summer, I will give information respecting that later.

Considering the character of the soil and the kind of crop grown upon it the past season, it is reasonable to suppose that the organic or vegetable matter which is so very necessary to be present in considerable quantities in order to grow a good crop of strawberries, has

There is no hoed crop so well adapted to prepare ground for strawberries as an early crop of potatoes. There is only one objection to them—they are heavy feeders on potash—just what the strawberries also demand, if you are after fruit more than plants in number; but this need not trouble you much when you can get that potash nearly free in the form of wood ashes.

New stable manure is not a good balanced ration for either the potato or strawberry, as it contains an excess of nitrogen for their wants; and in order to make it good food for such the proportion of nitrogen must be reduced, or that

let hogs in on it, and let them do the treading. The cool weather, and the ashes will, in a measure, keep it from over-heating.—E. W. W. Me.

J. M. Cushman cannot employ his team and hired man better than in drawing all the manure he can get on terms mentioned, and spreading it broadcast as drawn; it is far better than muck. If the application of ashes is deferred until next fall, it will be better for the strawberries. Fall planting is unadvisable for this section, as they cannot be set out early enough to be profitable. Cultural directions are given in all horticultural papers and are so simple that they need not be repeated here. The main points to be observed are to secure a deep rich soil, abundance of moisture, strong healthy plants, and then give them intelligent care. To secure the first two conditions, there is nothing better than well-rotted stable manure. It contains all the nutriment required if only used in sufficient quantities. To assist in the decomposition of the manure, some green crop to be plowed under, or two such crops if possible, will fit the land for the best results, but don't use buckwheat for that purpose. It has a tendency to sour the soil. Lime corrects the acidity, but is detrimental to the strawberry.—HENRY SNYDER, Md.

**Asparagus Sprengeri.**

The plant of *Asparagus Sprengeri* shown in the accompanying picture, is the one which took first prize at the recent Pennsylvania Horticultural Society's Chrysanthemum show.

The plant was only in a 6-inch pot last spring, and during the month of June got a shift into an 8-inch pot. The potting soil up to this shift was rotted sod and manure with some sand in proper proportions. Shifting into a 10-inch pot, half Jadoo and half soil was used, and for the final shift pure Jadoo. The plant was watered a few times with the Jadoo liquid 48 to 1, and grew quickly and strongly. No special care was exercised in its culture, in fact a good many of the long sprays were cut for decorative greens.

In potting *Asparagus Sprengeri* we do not ram the soil so tight as for Palms, etc., believing that only a medium tight potting allows the large corms and fibrous roots more room to develop properly. We have faith in the future of Jadoo fibre and liquid, but they must be used with intelligence and common sense.

PENNRock Co., Wilmington, Del.

**Notice to Readers.**

With this issue Vol. XVIII of *AMERICAN GARDENING* is brought to a close; an Index of Contents has been prepared and will be given gratis with next week's number.

Attention is further called to our notices and announcements on page 886 of this issue for particulars of prize competitions, etc.

We solicit from our readers notes of experience and observation. While our space is limited we will always manage to make room for any communication that contains germs of real, practical value to fellow-subscribers.

FIG. 246. ASPARAGUS SFRENGERI. (Grown in Jadoo.)

been pretty well exhausted. Of course the corn stubble and roots of the corn will furnish some of this organic matter, but in such a coarse state as to be of little value to the strawberry till it is refined; in fact, if it were to be planted to strawberries next spring, it would be better to remove all that one could conveniently with the spring-tooth harrow, or a like tool; but being plowed under in the spring, if they have not already been plowed under, and the ground planted to potatoes, their little value can be made practical use of. But it seems Mr. C. is well situated to supply this organic matter to the soil very cheaply.

of potash raised; and as the former cannot be practically done without a loss of the most valuable element of complete fertilizers, it is not, at least in this case, to be advised.

During these winter months when you can best afford the time, haul your manure and ashes, pile this under cover if convenient and to every cord of manure mix five bushels of ashes. You will want at least 30 cords of this mixture for your potatoes and some 50 bushels of ashes for a reserve for the strawberries. It will do no harm if the manure heats up a little, but if it heats up violently, it should be trodden down, or better still,

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 14, 1894.

PUBLISHED BY

A. T. DELAMARE Ptg. & Pub. Co. Ltd.

ROSE AND DUANE STS.,

RINELANDER BUILDING, NEW YORK.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1897, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 3 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

## "Royal Sport."

Our first Colored Supplement will be presented free to every reader of AMERICAN GARDENING with the issue of January 15.

It is a water color facsimile of the celebrated painting by Edmund H. Osthaus, renowned for his faithful and artistic rendering of dogs, and shows a beautiful spaniel emerging from the brush, carrying the game. The picture will be well worthy a frame, and we know will be appreciated.

**Clematis** THE more striking symptoms of this disease are **Dying Off.** (1) the leaves suddenly turn black; then (2) the vine dies down to a spot near the root that has a diseased appearance. Frequently, after a period of rest, the plant will take a fresh start, sending up a new shoot from the root. But the life of this growth is of short duration; for the plant that once dies down is doomed to perish soon.

In several issues of the present year attention has been called to the trouble experienced by many readers in growing the Clematis, and as a matter of general information we give the gist of a paper by Prof. Comstock which he presented to the meeting of the Western New York Horticultural Society in 1890.

At first sight there are strong reasons for locating the seat of the disease in a limited section of the vine near the

ground. This section has a diseased appearance; the plant dies down to this point; and later fresh shoots are sent out from below it as if the roots were healthy. It was doubtless these reasons that led Professor Arthur to look upon a fungus which he found in the plant at this point as the cause of the disease. But my studies, says Prof. Comstock, have convinced me that this fungus simply accompanies the disease, and that the cause of it is something very different.

Every grower of Clematis has observed knotty growths of varying size upon the roots of some of the plants. It is in these knots or galls, that the cause of the disease is to be found. If a gall be cut across and the section examined with a hand lens of moderately high power, there will be found embedded in the abnormal plant growth, small, pear-shaped bodies of the same color as the cut surface of the root, but rendered easily visible by their smooth, polished surface. These pear-shaped bodies are sacs containing a large number of eggs. In fact, each sac is the body of a worm which has become greatly distended by the eggs which have been developed within it. It is these worms cankering the roots of the plants that cause the disease; and, as they multiply rapidly, when soil becomes infested by them the spread of the disease is terrible.

The animals in question are worms, belonging to the order known to zoologists as the Nematodes, or thread-worms. The species of this order that have attracted the attention of gardeners abroad are commonly known as eel-worms. A good illustration of the order is the "vinegar eel," a minute creature often seen wriggling near the surface of vinegar. The majority of the species are, like the "vinegar eel," harmless, feeding upon dead or decaying vegetable matter. A few species attack growing plants.

Both sexes of this species when young are very minute, requiring a high power of the microscope to detect them, and are thread-like in form. They can crawl very rapidly, and it is in this stage that the species is spread from plant to plant. The males undergo some remarkable changes, but are always more or less thread-like. The females, after finding lodging places in the tissues of the roots and becoming fertilized, become distended in a remarkable manner, assuming the pear shape already described, and becoming of sufficient size to be seen by means of a simple lens.

The range of plants infested by eel-worm is very great. It is already known to attack at least 75 species of plants belonging to widely different orders. It is found in diseased roots of Roses; it is very common in Begonias; it does a good deal of injury to cucumbers, potatoes and tomatoes. In the South it is especially destructive to peach, grape, and garden vegetables, including cabbage, turnip, lettuce, beet, parsnip, egg-plant, and melon. This wide range of food plants is the most discouraging element in the treatment of this disease. In fact, it does not seem that we are in condition to name with any great degree of certainty any plant on which the worms cannot live. In this direction lies an important field for future experiments. When such plants have been determined,

the cultivation of them on infested ground, and thus starving out the worms, will be the most practicable way of meeting the evil in the case of field crops.

A German writer, Professor Kuehn, strongly urges the use of what he terms catch-plants against the species that infests sugar beet. He has used rape as a catch-plant. This is sown on infested fields; the young worms in the soil penetrate the roots of the plants. After the roots have become infested, but before the females have begun to produce young, the plants are pulled up and destroyed. In this way several crops of rape are produced upon the infested field one after another in the same season, each succeeding crop tending to entrap the worms remaining in the soil. But, obviously, the use of catch-plants is a very expensive method of fighting the pests, and yet it is an expense that would be gladly met by the owners of valuable lands if they could feel sure of such results as these reported by Professor Kuehn.

As regards remedial measures, Prof. Comstock remarks: "It seems to me, that the growers of Clematis can at once, without waiting for further discoveries, reduce their losses to the minimum by a little care in the management of their plant-houses, in the procuring of potting soil and in the choice of fields for planting out.

"The conditions in some of our establishments where Clematis is grown are those most favorable for the multiplication and perpetuation of the disease. The benches upon which the pots stand are covered with gravel or coal ashes, which is changed at infrequent intervals; the roots of the diseased plants pass through the hole in the bottom of the pot and ramify in the gravel or ashes, and the worms follow the roots, infest them, and this soil becomes a breeding place for the pest. When another lot of plants is placed upon such soil, obviously in a short time these plants will become diseased. It is recommended, therefore, that between each two lots of plants the soil be carefully removed from the benches and placed where it will not contaminate other crops; that before renewing the soil the benches be thoroughly washed with lye so as to destroy any worms that may be lodged in the cracks; that the soil for potting be carefully selected so that it shall not be a source of infection; that in planting out great care be taken to make sure that it be done on land which is free from this worm; if any roots of any kind are found in the soil which have unnatural swellings upon them, the field should not be used, as there will be a strong probability that such swellings are galls made by this worm; and finally, until a grower is able to produce only healthy plants he should not use root-grafts, for roots that are apparently healthy often contain the worms."

A Sample of Many.—The paper the last two weeks is simply immense. If I can only make some others think the same I will be happy.—W. E. RUTAN, N. J.

Horticultural Books.—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send 2c. stamp for our new catalogue.

## THE QUESTION BOX

He that questioneth much shall learn much.—BACON.

Readers are invited to forward particulars of any difficulty or perplexity that they have encountered. If the question be one of general interest it will be inserted in this column, so that other readers who may have information to impart can assist their brethren by recounting their own experiences. Questions of a purely individual interest will be replied to by the Editor under the head of "Short Answers."

Questions submitted in this department will receive the full attention of the staff of AMERICAN GARDENING and when desirable will be answered editorially.

All communications for insertion should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR of AMERICAN GARDENING, P. O. Box 1897, New York City. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query or answer are sent, each should be on a separate piece of paper.

Answers should always bear the title of the query replied to and the page on which it appeared, and our readers will greatly oblige us by advising, as far as their knowledge and observations permit, the correspondents who seek assistance. Conditions, soils, and means vary so infinitely that several answers to the same question may often be very useful, and those who reply would do well to mention the localities in which the experience was gained.

**Important to Querists.**—Correspondents must look through the whole of the paper for replies to their queries. Answers cannot always be given the week after the queries are received, but there is as little delay as possible in dealing with them.

**Cash Prizes** will be given for the best set of answers each week. Payment to be made monthly.

### Wants Horse Radish.

Can any one tell me where in New York to purchase a barrel or two of horse radish roots? Or how is it sold? I do not find it quoted in your market reports.—J. THORNLEY, New Britain, Conn.

### Exterminating Moles.

What are the best, simplest and most efficacious and quickest ways of exterminating ground moles from the lawn and bulb beds; or what will induce them "to move on" to somebody else's place? My garden is full of bulbs, and the moles are playing havoc among the beds and in the lawn. There was not a mole on the place two weeks ago. Can they be chased out, or suffocated by pouring oils or acids down the runs? I have tried dogs, but they simply ruin the place, and don't catch the moles.—CHAS. H. DAVIS.

### Best Variety of Tomatoes.

Which is considered to be the best variety of tomato for ordinary purposes?—W. B. LONGSTRETH, Ohio.

### Platanus Occidentalis.

Will you kindly tell me through your valuable paper what the shade tree *Platanus occidentalis* is, and whether it is adapted to Iowa?—W. B. B.

### For a Shrubbery Bed.

What shrubs should be used in a triangular bed of foliage 20 feet on each side, the object being to obtain as dense a mass of foliage as possible, from four to ten feet high, or possibly higher than that in the center.—W. B. B., Ia.

### Chinese Lily.

Can I grow Chinese Lily with dwarf foliage? mine always grow with the foliage as high as the flowers.—A. A.

### Pertaining to Roses.

I have a bed, especially prepared, which will accommodate 36 Roses. I want to plant the hybrid tea class. For the purpose I want such varieties as can be carried through the winter, with moderate protection, in this climate

where it sometimes goes to 18 or 20 degrees below zero, though not often.

I had in mind the following varieties: Duchess of Albany, Mme. Caroline Testout, Kaiserin Augusta Victoria, President Carnot, and Meteor.

Can you suggest a better list, and describe best mode of winter protection of such varieties when planted in a solid bed, and what of the hardiness of the two varieties, President Carnot and Kaiserin Augusta Victoria. My aim is to procure a permanent bed by giving proper attention?—W. O. C., Missouri.

### Preserving the Cassabanana.

Will some one who has been successful in preserving this fruit kindly give his or her experience in these columns?

As I do not see seed of above plant listed in any catalogue, I would be pleased to send each reader of AMERICAN GARDENING a few seeds gratis on receipt of stamp to pay postage.—SID. J. YANCEY, Covington, Ga.

### When to Trim Apple Trees.

When is the best time to trim old apple trees that have been neglected for years? What treatment would be recommended besides trimming?—M. J. B.

### Repairing a Hedge Row.

I have lately bought a farm here, and there are a great many thorn hedges, but there are a few gaps where the hedge has died which look bad and make the fence useless. The hedge is about three feet high and has been kept trimmed. What had I better do to fill those places soon, and where would I be likely to buy the plants or trees?—MRS. A. HAMLEN, Flemington, N. J.

### Raising Sensitive Plants.

Will some one please tell me how to raise sensitive plants (*Mimosa pudica*)?—W. A. S., O.

### Margaret or Marguerite Strawberry.

I have a few fall-set Margaret strawberry plants and have recently seen the Marguerite very highly spoken of. Are they one and the same kind?—W. E. R.

### Best Early Vegetables.

What is considered the best extra early bean for market gardeners? Also the best early cucumber? I planted White Spine cucumbers last spring (outdoors) and they blossomed for three weeks before they set a cucumber.—W. L. MESPLAY.

### Wants Worm Proof Corn.

My extra early sweet corn was rendered almost unmarketable this year by the worm which appears to enter at the silk. Is there any variety of extra early corn (good for roasting ears) which is not thus infested? I have heard that the Early Pearl was good. Is it extra early?—W. L. MESPLAY.

### Moving Rambler Rose.

I have a two-year-old Crimson Rambler Rose (with several branches, two of them 15 feet long) planted in my back garden. Can I move it to the front without injuring next year's crop of flowers? If yes, how, and at about what time in the spring is best? I wish to make a show with it, as I think it will be something grand, judging by what it did this spring with two little three-foot whips.—W. E. R., N. J.

### How to Use Horse Manure.

(1) What is the best way to apply fresh horse manure to land on which crops are growing, as mulch or hoed in?  
(2) In which way will land in the long run get most good from horse manure, by composting or by applying it to the land while fresh?—J. J. H., Fla.

### Germinating Sand Pear.

Can you give us any information with reference to germinating Japan pear

seed? This is a very desirable stock in this section, but it is difficult to germinate.—FLORIDA.

### Care of Lælias.

I have lately received some large plants *Lælia alba* and *L. anceps* on block; the clumps are separated into several distinct plants with numbers of dead bulbs among them. Should they not be divided and if so, when? Do they do best on blocks or in basket? I find your paper of great help to me and wish you long-continued success.—C. R. H.

### Planting a Pond.

I have a pond which is about 80 feet in diameter and slopes toward the center where it is about 2 feet deep. The pond is supplied by rain water from the roofs, also by an artesian well which flows into the well at the rate of about 10 gallons per minute. I keep some ducks who use the pond. I would like to plant some plants and shrubs in and around the pond, and ask for advice as to what plants or shrubs would be best suited, and how to go about planting same.—ABITA SPRINGS, Fla.

### Ground Crickets.

I have made two sowings of beets and carrots, but have no plants to show for my labor. The seed sprouted and the little plants could distinctly be seen in the rows, but next morning they had disappeared; as other plants came up day by day, so they disappeared next morning. On examining the situation I found that the ground was perforated with holes the size of a pencil, looking like ant-holes. My neighbors inform me that the destructive cause is "ground crickets." How can I get rid of them or protect my young plants?—ABITA SPRINGS.

### Culture of Geraniums.

Will you through your Question Box have some one give the proper treatment, including temperature, of the Lady Washington Geraniums, so-called, from the time they leave the cutting bench till they bloom.—JOSEPH H. SPERRY.

### A Neglected Berry Patch.

Last spring I planted 5,000 strawberries at my country home, which I can only go to about once a month. I hired a man to cultivate it, which he did—when he had nothing else to do. The result is an elegant crop of pig weed three feet high.

What is best for me to do—plow the field up and start over? If I should cut down the weeds, cultivate, fertilize and mulch next spring, would I probably get berries enough to pay the expenses of the plot?

I have to hire it all done, as I can only go there on Sundays.—P. J. STUYVESANT.

### Fluck Mulch for Strawberries.

Will not fine muck, procurable upon the place, make a good winter protection for strawberry plants in the hill. Also, if used alone or combined with ashes would it also be a winter and spring fertilizer? Would slacked lime be of additional use in this way? How much to use? Would it be of use to put any mulch of any kind between the rows, with this mulching upon plants, until ready for summer mulching with straw; with our sandy land and no standing water?—J. M. CUSHMAN, Mich.

### Flaggots on Cucumbers.

Many of the cucumber-growers under glass of this vicinity are troubled with a small maggot about an eighth of an inch long, white, with a dark streak through the body. It turns into a small knat-like fly. They attack the roots of the cucumbers and the vine suddenly wilts and dies. Can any of the readers of the magazine suggest a remedy? The earth is new sod mixed with fresh stable manure.—P. F. W., Ill.

**Short Answers.**

(To J. Bradley.)—The Carnation leaves show a bad attack of the "rust" disease. Try to induce a brisk growth on the plants as soon as the days begin to brighten.

(To J. C. G.)—Your Hollyhocks are attacked by the Hollyhock disease (*Puccinia malvacearum*). Destroy very badly diseased plants by burning and use Bordeaux mixture freely on the rest; it may save some, but it is doubtful.

(To J. W. G.)—Designs for poultry houses alone or combined with other structures can be found in the Poultry Keeper illustrated Quarterly, No. 1; price 25c.

(To J. C.)—The shoot sent was crushed to a pulp by the cancelling stamp used in the mails. Please send fresh material packed in a box with damp moss or blotting paper. Possibly it was *Gynura aurantiaca*.

(To J. J. H.)—Time will hasten the decomposition of the pile.

## Monthly Competition

A cash prize of \$5.00 per column is offered for the most instructive practical essay on

### Lettuce Forcing.

Manuscripts must be received at this office by January 1 and should be of about two columns in length. All MSS. submitted in this or any competition becomes the property of AM. GARDENING.

Subject for the February competition will be announced in good time.

### Answers Prize Award.

The prize offered for the best set of answers to the letters published in one week's Question Box has this week been awarded to W. M. Edwards, Darien, Conn. and a check for \$5.00 is sent this day.

To the Editor of American Gardening.

Your letter of December 11, with check for \$5 has been received, and I thank you very much. This award for the set of best answers, and at the same time the honor of being the first to receive such award is indeed very gratifying and flattering to me. This new policy of giving an award for the best answers will undoubtedly be very much appreciated by the patrons of AMERICAN GARDENING, and will, in my opinion, bring you many new subscribers and cause the old ones to exert themselves to make your already highly educational journal more interesting than ever.—MAX MUNTE.

Cambridge City, Ind., Dec. 1897.

Received from AMERICAN GARDENING, Five Dollars, said sum being amount of prize awarded me for best set of answers to Question Box for current week of Dec. 11.

\$5.00.

(Signed)

MAX MUNTE.

The New Jersey State Horticultural Society will hold its 23d annual meeting in the State House, Trenton, on Wednesday and Thursday, January 5 and 6, 1898.

Every good gardener wants the best books. Our new catalogue of selected books is the best guide out. Sent for 2c. stamp.

## Concerning the Future.

[Reprinted from last issue.]

### What's in a Name?

Sometimes much; sometimes nothing. AMERICAN GARDENING is a good name and will live. But a single title, however, does not always indicate all that is carried between two covers. And so it is with AMERICAN GARDENING to which we are thinking of adding a sub-title so that all may appreciate the comprehensiveness of their favorite paper. It is our intention in 1898 to make the paper so broad in its scope that every one who dwells in country and suburbs will be irresistibly drawn toward it, because they will find subjects of value to them not to be found in any other publication. We intend to cover every phase of interest in country life, excepting broad agriculture, which is now so ably cared for by many valuable contemporaries. We ask our readers for pointers in the above direction, and will pay handsomely for all articles of general interest affecting the millions who reside in the country.

The greatest encouragement our readers can confer upon us, and that which will be most agreeable to us, is the prompt renewal of their expiring subscriptions. If, with this, you will at same time forward one new subscription, you will have testified to the full your appreciation of our efforts.

### The Question Box.

Winter season is the time for study, for work does not press quite so hard. If you want information on any subject connected with life in the country, send in your question. It will have faithful attention. And if it's a question of general interest it will be covered in such a manner as not only to please you, but may be the means of aiding scores and hundreds. Also see if you can't answer some of the questions asked, and so earn one of our \$5 prizes?

### The Monthly Prize Essay.

This feature should surely be the means of drawing out some remarkably good things. If you have a subject in your mind you would like to see fully covered, let us hear from you. Practical suggestion is what we want, and \$5 a column to the winner is fairly good pay.

### Advertisers, One Word With You.

We have a large number of contracts to begin the year with. Is yours among them? If not, you may be sorry, for AMERICAN GARDENING is going to boom in the year of 1898 as never before, and it's a pity to lose good opportunities for paying investments nowadays.

### The Improved Appearance.

The improved appearance of AMERICAN GARDENING is an earnest of what is in store for subscribers throughout 1898. Notice the increased number of pages, heavier paper, more readable type. Above all, read our Announcements! Then let us hear from you if you know of any better or more valuable paper to the dweller in the country. If you do, we are open to suggestions for still further improvement. With your own renewal, send us two or three new subscriptions; that's the kind of appreciation all publishers value.

### Our 1898 Art Calendar.

Subscribers desiring one of these really magnificent calendars should send in their renewals at once. We have printed scores of testimonials in recent issues to show the esteem in which they are held by subscribers who have received copies, and we stand in no fear of contradiction of our claim that never before has such a tasty, handsome, and valuable calendar been offered by any publication for so little money.

Order now while we still have a supply on hand. Verb. sap!

## Northern Illinois Horticulturists.

The thirty-first annual meeting of the Horticultural Society of northern Illinois held at DeKalb, was one of the most interesting meetings ever held by the Society. The fine exhibits of apples and potatoes were a surprise to most people in this year of short crops of those articles. Among the papers presented and discussed were: "Shall the orchard be allowed to go to grass?" H. R. Cotta, Freeport; "Vegetables for the farmer," Mrs. Emma Groh, Dixon; "Protection of our song birds," Mrs. A. W. Flak, DeKalb; "New ideas in potato culture," L. H. Read, Grand Rapids, Wisconsin; "Spraying for insect enemies," J. L. Hartwell, Dixon; "Marketing fruits and vegetables from a grocers' standpoint," C. G. Bodman, DeKalb; "Small fruit for the average farmer," E. S. Furman, El Paso; "Pansy and pansy seeds," William Toole, Baraboo, Wis.; "Results of plant variation," Jonathan Perian, Chicago; "Does it pay to bother with flowers?" Mrs. Clinton Rosette, DeKalb; "Fruit culture versus general farming; pleasures and profits of," B. F. Wyman, Sycamore; "The child and the garden," Col. F. W. Parker (of the Cook County Normal School).

Mrs. Jennie M. Willson, Mears, Mich., won the prize of \$15 for best essay upon the topic, "Why and how should horticulture be taught in rural schools?"

The officers elected for the ensuing year were: J. L. Hartwell, Dixon, Pres; H. R. Cotta, Freeport, first vice-president; J. Friend, Nekoma, second vice-president; Lewis Ulm, Sterling, third vice-president; Dwight Herrick, Rochelle, secretary; L. Woodard, Marengo, treasurer.

Prof. Jas. Troop, of Lafayette, Ind., has been appointed by the Governor as State Entomologist of Indiana.

## Announcement

The publishers of AMERICAN GARDENING, in order to increase interest among readers, as well as to add value to their paper, make the following liberal offers for 1898:

### A Cash Prize

Each week, for the Best Photograph of Well-grown Plant, with description as to how the result shown was obtained; or for other suitable illustrative photograph and text. As high as \$5.00 a week will be paid, according to merit.

### A Cash Prize

Each week for Best Set of Answers to the Question Box of the week previous. As high as \$5.00 a week will be paid, according to merit.

### A Cash Prize

Every month for the Best Essay on an announced subject of general interest. Subject for each month to be announced in due time. Essays not to exceed two columns, and \$5.00 per column will be paid for the best essay. All essays submitted become the property of AMERICAN GARDENING.

### OTHER 1898 FEATURES:

### Art Supplement Free

In colors. Once each month—to every subscriber in good standing.

### Literary Supplement

Monthly—For Advanced Readers.

## Mr. P. H. Jacobs.

As was announced in our issue of last week, we have secured the services of Mr. P. H. Jacobs to conduct the poultry column in AMERICAN GARDENING during the coming year.

The close association of the poultry yard and the garden in thousands of country and suburban homes authorizes the course of giving that adjunct a decided prominence in these columns and to small poultry raisers AMERICAN GARDENING thus becomes an invaluable weekly guide and aid.

In placing the department in the hands of Mr. Jacobs, our poultry matter at once assumes an authoritative rank; and a few details as to the career of that gentleman are now presented so that readers may know what manner of man it is who instructs and advises them.

Mr. P. H. Jacobs was born near Rich-

## The Bee Keeper.

### Comb Foundation.

Comb foundation has been used for more than twenty years by large apiarists, and in that time many valuable improvements have been made in its manufacture. It also has been greatly reduced in price. It is used almost universally by our most progressive beekeepers and rarely can anyone be found who would condemn its use.

Careful investigation has proven to us that the bees must consume at least 12 pounds of honey, possibly more, to secrete wax sufficient to build one pound of comb; thus combs weighing one pound cost about \$2 at a low estimate, counting the honey and time for building.

We can purchase comb foundation at an average price of 45c. to 50c. per

times as much drone comb as is profitable to the beekeeper. Thousands of dollars are lost annually by this one item of rearing and feeding millions of useless drones. By the use of comb foundation in the brood nest all this can be saved.

The use of foundation in the surplus case is often more profitable yet than in the brood chamber. As a rule, we do not put the surplus cases on until the brood combs are filled with brood and honey, and the bees would not enter them were we to put them on sooner, so the bees want room immediately to store the honey that is generally coming in rapidly. If we use no comb foundation in the sections, the bees have to build every bit of comb, and often by the time they get right under way of comb building and have many sections half or three-fourths full, the honey flow is over, or nearly so, and we have any number of half-finished sections that are not marketable.

The best we can then do then is to extract the little honey, which is three times the trouble it is worth, and store the sections for next season which is a nuisance as any one who has tried it can testify. The moth, the mice, the ants and what not will continually try to ruin them for us.

I advise my readers from practical experience, not to keep any more colonies than they can readily handle and take good care of, then use the best hives and the best modern methods, and, to their surprise, many will learn that bees are more profitable than any other branch of industry on the rural home.

L. W. LIGHTY, Pa.

FIG. 247.—MR. P. H. JACOBS (Poultry expert).

mond, Va., in 1841, on a large plantation where vegetables and fruits were specialties. He became interested in agricultural problems at an early age and especially studied the theories of Edmund Ruffin, the pioneer of American agricultural science. Later moving to Philadelphia, he completed his studies in chemistry.

At a very early age poultry had an attraction for the young Jacobs, and in 1852 he began to engage in what has been his life interest. The Shanghai was the first breed he handled.

Mr. Jacobs is also a practised newspaper hand, having for the past twelve years edited the Poultry Keeper, which journal he still conducts. He is also agricultural editor of the Philadelphia Record and of the Implement Age, and was formerly editor of the American Fertilizer, Farmers' Magazine, and Field, Farm and Stockman.

Mr. Jacobs is a practical poultryman who speaks from experience. His first contribution appears next week.

pound. This comb foundation the bees can draw out and have ready to store honey, or raise brood, in a very short time. Not only is there this saving of money and time, but we secure nice straight combs. Combs that are the pride of any beekeeper as they can be manipulated so easily, can be interchanged when needed and have no offsets and bulges to smash bees and ruin brood. If desired for extracting they can be uncapped very quickly and will be a source of pleasure whenever the apiarist needs to handle them.

By the use of foundation we can secure nearly all worker comb and anyone who has fed a big hoard of drones for a few seasons knows well the cost thereof. For instance, if you were keeping poultry for the profit in eggs, and kept and fed about one-third roosters, the profit would be cut in half, no doubt. The same holds good in the bee yard. If the bees are allowed to build their own comb as they desire, they will build ten

The Tree Planting Association of New York City held its second annual meeting recently. The annual reports encouraged the members. The association now has 172 members, and a snug little balance in its treasury. Thirty-two new members have joined during the last month, many of them women. The great majority of the members consists of old New York people, owners of much real estate. The reports show 126 trees planted in the city since October.

### The Henry Strawberry.

Arrangements have been made whereby a bountiful supply of these plants will be ready for spring delivery to subscribers and agents, and in this connection we beg to call the attention of our readers to our generous offer of these plants in another column. We do not think that a more liberal offer has ever been made than the one now advertised, whereby the agent or worker sending us in a club of ten new names, at \$1 each, becomes entitled to 100 Henry Strawberry plants, while five plants will be sent postpaid to each person in his club. This offer will not apply to a club of less than ten. It may be a very long time before such an offer of such a plant can be made again. The wonderful success which has accompanied our premium offer this fall, in the short time at our disposal to advertise it, leads us to believe that the orders for the Henry Strawberry next spring may exceed all anticipations; however, we have planned for a large supply for delivery and trust to be able to meet all demands upon us. Mr. Jerolaman's series of articles is now being placed in pamphlet form, and copies will be mailed free to all who desire to see same in the canvas for new subscriptions.

## There is Not a Home in the Land

But calls for a yearly Calendar.

Every family tries to get one or more; generally more.

## There are Calendars and Calendars

Some are good, some bad, most of them indifferent.

## There Will Not be a Calendar Issued for 1898

To exceed in artistic elegance, finish, beauty of designs and effective coloring, the one we to-day offer as a premium to every subscription to AMERICAN GARDENING received before December 31, 1897.

# EVERY SUBSCRIBER IS ENTITLED TO ONE

AND CAN EASILY EARN TWENTY.

OUR magnificent **Rose and Girl 1898** six sheet **Art Calendar**, two months to a sheet, each sheet  $8\frac{1}{2} \times 11\frac{1}{4}$  inches, is superbly lithographed in eleven colors, and printed on hammered paper; the whole tastefully tied with silk bow—undoubtedly a work of art fit for the most elegant home, and as handsome a Calendar as was ever published. Each one of the six designs presents a distinct type of female loveliness and a fresh study in roses, the coloring on each sheet being rendered in harmony with the design. There is not a line of advertising on the Calendars to detract from their value. They will not be sold by us for less than \$1.00 each.

### Description

### Who is Entitled to a Calendar?

**EVERY SUBSCRIBER** renewing before December 31, 1897, enclosing Five Cents additional to pay packing and postage.

**EVERY NEW SUBSCRIPTION**—To induce people to test the value of AMERICAN GARDENING we will send the Calendar absolutely free to every name received direct not previously on our mailing list. Remit \$1.00 for A. G. 12 months.

**EVERY ONE** sending us a club of Four 3-month trial subscriptions at twenty-five cents each, will get a Calendar, free as a premium, by return mail.

**EVERY NEW** name sent in by an agent.

NOTE.—We have ordered manufactured for us a large stock of these superb Calendars in the endeavor to have sufficient supply for all demands, but will not guarantee to fill orders after supply is exhausted. Therefore, order yours now.

### Special to Agents

A copy of our Art Calendar to show people will clinch the argument and obtain the subscription. Bona fide Agents will be mailed one copy, securely wrapped, on receipt of only Twenty-five cents (one-fourth its value.) Armed with this superb Calendar we misjudge human nature greatly if any ordinary mortal cannot secure a big list of new subscriptions every day. Every new subscriber you send us gets a Calendar by return mail.

### We Pay Agents

Every new subscription at \$1.00 entitles the agent to **Five of the Wonderful Henry Strawberry Plants**, to be delivered next Spring. Thus 100 new subscriptions would secure agents 500 plants; a possession worthy of your consideration. Every new subscriber taken by agent will receive one of our Art Calendars free by return mail.

Agents who do not want the Henry Strawberry Plants can retain as their payment **20 cents in cash** on each subscription they take, or will be credited **twenty-five cents** on any book, magazine or publication they wish to obtain through us.

Address all  
correspondence

**AMERICAN GARDENING, P. O. Box 1697, New York.**

REMIT BY P. O. or EXPRESS MONEY ORDER—IT IS SAFEST.

## The Window Garden.

### Flowers and Plants in the Home.

A gentleman, in delivering a recent lecture on the crying topic, "How to keep the boys on the farm," gave, as one factor, flowers in the home. Boys who are brought up in the same house with flowers, or, even better, decorative plants, which are more sure to remain presentable with little work—are more certain to love the home, and its surroundings. This is especially the case if their early interest in these things, as evinced by questioning, is encouraged, instead of the reverse. There is interest enough in the build of a single flower to keep the boy at home where flowers grow, if this interest is wisely fostered.

### Home-made Jardinieres.

Burnt poker work on the plainest of receptacles may make a very pretty substitute for the more expensive jardiniere. Crimped tissue paper in pale green tints may be applied directly to strawberry baskets, when used as receptacles for bulbs; or, it may be used to cover pasteboard forms plainly in a way to make a useful and rather lasting receiver for unsightly pots. If one desire to use decorations in color directly on the pots, it is far preferable to let the painted pot be a secondary one, inside which the plant, potted in one a size smaller, may rest and flourish. These are, perhaps, the cheapest "jardinieres."

### Last Year's Novelties.

Since it is said that we are not to have a large number of novelties of value for the coming year, it behooves us to take a good look at those of last year for selection. The trend of the floral world is shown by a comprehensive look at these. Seedsmen are working largely on outdoor stuff, to meet the largely increased interest in this class of plants. One firm offered last year some 35 floral novelties, of which only four were to be grown indoors, and at least two of the four will be seen oftener outside.

### Newer Things for Indoor Use

The value of the Gynura, Asparagus Sprengeri, Aubtillon Savitzii, etc., has several times been reverted to. The last two will be likely to be among the most popular of the newer things for the year to come. The Nasturtium, known as Mme. Gunther's Hybrids, are very good for the window-box. Much of the seed sent out last year seemed to be mixed with that of the old climbing Nasturtium. The Giant White Daisy fills a need of the Daisy lover when field Daisies are gone, while the brilliant new Salvia, Clara Bedman, can be used anywhere with good results. We have found the Begonia Vulcan, somewhat disappointing, and have not heard enough reports of it to know how it has met the general liking. Geranium, Agnes Kelway, received last spring, has not yet bloomed, and has not been seen on exhibition.

### Growing the Stephanotis.

A most delightful old plant is this, one hardly to be surpassed either for beauty or fragrance. Yet how seldom is it seen in cultivation in the collection of the amateur. To be sure, it is not a winter bloomer, but this very fact is in its

favor, in one way, as being a heat lover, it will not have so much to contend against, while making its growth and flowering. While resting during the winter it will be satisfied with as little heat as 50 degrees, or even less. Pruning is scarcely necessary, except to cut out weak or used-up wood. The time for re-potting is early in the season, at about the time new growth commences. Plenty of sand, with leaf mould, and fibrous loam, will form a good soil mixture.

### Typical Roses

Some time ago Gardening Illustrated gave a series of photographs of Roses representing various typical forms. For the Tea Rose, Catherine Mermet was the first chosen. The Bride furnished another example of perfection of form, while Anna Olivier and Souv. d'un Ami were used to show buds of varying type. Celeste showed small, semi-double blooms somewhat resembling the Rose, better known here, Cecile Brunner. Glorie Lyonnaise represented the flat-tish, recurved form. A. K. Williams showed the flat, and Susanne de Rodocanachi the deep, globular bloom among the hybrid perpetuals.

### Care in Watering.

If soils are not fully porous naturally, or if they are well filled with roots, it is quite common at this season for plants to fall when good care seems to be given. The trouble, too often, is that the water given rushes through some fissure, or else does not pass through at all; and, in either case, the plant does not receive the root watering which the owner apparently gives. The motions are gone through, without the proper result. This state of things is especially bad for decorative stuff like Aspidistras, Palms, and Ferns. One severe drying at the root may destroy the usefulness of such plants. For this reason let the grower be sure the water applied reaches its destination and does its work. [Best to plunge the pot in a tub of water—Ed.]

### Window Violets.

It is indeed hardihood for the window grower to attempt Violets, when so many professionals are unable to cope with the difficulties connected with their successful blooming. Too much heat and too little air are likely to be the chief kindnesses (?) which the plants will have to fight under. In full sunshine they are liable to droop, and to become infested with red spider. The temperature runs best in the forties. We have Princess of Wales doing very well in 50 to 55 degrees, and are awaiting its further behavior with deep interest. M. V. NORRIS.

### How's This!

We offer One Hundred Dollars reward for any case of Catarrh that cannot be cured by Hall's Catarrh Cure.

F. J. CHENEY & CO., Toledo, O.  
We, the undersigned, have known F. J. Cheney for the last 15 years, and believe him perfectly honorable in all business transactions and financially able to carry out any obligations made by their firm.

WEST & TRUAX, Wholesale Druggists, Toledo, O.  
WALDING, KINNAN & MARVIN, Wholesale Druggists, Toledo, O.

Hall's Catarrh Cure is taken internally, acting directly upon the blood and mucous surfaces of the system. Testimonials sent free. Price 75c. per bottle. Sold by all Druggists.

### Packing Specimens for Mail.

It is ever our desire to serve readers as far as we possibly can in the direction of naming any plant, insect, or what not that may be sent to us. We, however, do not care to make any attempt at identification unless the specimens sent are ample, complete, and in proper condition.

It is not sufficient to put a leaf of a plant, especially if succulent, into an ordinary letter package—it will surely get crushed in transit. Correspondents sending material for naming are asked to send plants or shoots in a box packed with damp moss or bibulous paper; the object is to retain freshness and the original form as much as possible.

Insects should be suitably enclosed in vials or small boxes.

### Business Cards.

C. D. ZIMMERMAN, Buffalo, N. Y. Horticulturist  
Landscape Gardener. Plans and estimates furnished

LAND DEVELOPMENT, consultations, plans, superintendence, plants, labor, etc., supplied for work as wanted. 100 original designs for residences, gardens, parks, etc., ready for inspection. Communications solicited from those who require the value of land or residence developed with practical economy. Jos. Forsyth Johnson, P. O. Box 1697, New York City.

### Situations Wanted.

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

GARDENER, single, desires a situation on private or commercial place; good references. F. G., 43 Renwick St., N. Y. City.

WANTED a situation; by a thoroughly practical gardener of life experience in all branches; single, best references. Address T. D., care Mr. Hermann, 1491 Amsterdam Ave., New York.

GARDENER wants situation; trustworthy and reliable, experienced in all branches, able to take full charge of gentleman's place, also to lay out grounds, make lawns, etc.; references given. Address Fred. C. Rose, Flanders N. J.

### FOR SALE.

Advertisements not to exceed eighty words will be inserted under this heading at TWO CENTS PER WORD each insertion, payable in advance. The address will be charged as part of the advertisement, and each initial, or a number, counts as one word. No cuts or display type allowed.

STRAWBERRIES, Potato Seeds. Wm. A. Olds, Okemos, Mich.

GLASS at wholesale, rock bottom prices. Also paint for greenhouses. The Reed Glass & Paint Co., 456 W. Broadway, New York.

WASHINGTON Grape; fine foliage, fine blossom, fine fruit; for pots or garden; fine plants ten cents postpaid; order now. T. J. Miller, Olympia, Wash.

L. C. BOBBINK, Rutherford, N. J.—Dutch Bulbs, Clematis, Magnolias, Rhododendrons, Asaleas, etc. Branch of the Horticultural Company, Boskoop, Holland.

DO YOU WANT the best flower pots? If so, send address to The Whildin Pottery Co., 718 Wharton St., Philadelphia. Three shipping points, can save you freight.

STRAWBERRY plants 25c. each, of Clyde, Glen Mary, Wm. Belt and Bismark, sent prepaid for one dollar. Catalogue free. Enos W. Dunham, Stevensville, Mich.

AMERICAN GARDENING, 12 volumes, 1886 to 1897 inclusive; Popular Gardening, volumes 2, 3, 4, 5, 6; Gardening, volumes 3-4 and part of 2 and 5. G. A. Earl, 47 Cherry St., Oneida, N. Y.

20 VARIETIES of pedigreed strawberry plants, \$2.00 per 1000, or 1000 of 100 each, \$3.00. Send for list of varieties. La Porte Nursery, H. W. Henry, Proprietor, La Porte, Ind., 50 miles east of Chicago.

DIRECT from the grower, duty free. Hulsebosch Brothers' Seed, Bulb, and Plant Catalogue is now out, prices very reasonable, anybody who has not received a copy should address Hulsebosch Bros., Englewood, N. J.

# The Henry Strawberry!

**To Meet** The extraordinary demand for this unequalled Strawberry we are preparing 100,000 Henry plants for delivery through next Spring to

## Premium Earners

Henry Strawberry Plants can be obtained solely through a subscription to AMERICAN GARDENING; as the publishers will not sell plants under any consideration;

Neither will Mr. Jerolaman who has signed a contract with us to that effect.

## Who is Entitled to Plants

### NEW SUBS. AND RENEWALS

Five plants of the Henry will be mailed, postpaid, as a premium to every Renewal or New Subscriber sending us \$1.00 for a year's subscription. When remitting be sure to state if you want this premium.

### TO AGENTS AND WORKERS

For every \$1.00 received from agents and present subscribers for New Subscriptions, we mail, postpaid, Ten Henry plants, Five to the New Subscriber and Five to the Agent.

## Special to Club Raisers!

### CLUBS OF TEN

To every agent sending us in a club of Ten New Names and \$10.00 we will forward in payment therefor One Hundred (100) Henry Strawberry Plants, by express, as well as send Five plants, postpaid, to each person in the club.

All orders are now held for Spring Delivery....

The series of articles on "Big Berries for All," written by Mr. H. Jerolaman for AMERICAN GARDENING, with additions, will soon be in pamphlet form; and agents and friends will be supplied with copies on receipt of stamp. It will be the most unique pamphlet on the Strawberry ever issued.

Address Your Letters to

**AMERICAN GARDENING, NEW YORK.**

## The Poultry Yard.

### The Black Langshan.

Concerning the remarkable record of the Langshan fowl, a recent writer has said: "With a color which has never been popular in this country, with legs that are of an undesirable shade for market purposes, with a skin that lacks the desired yellow hue, and with all sorts of opposition, it has succeeded in making itself a popular fowl."

Even within the ranks of its own defenders, this breed has had much to contend against, for perhaps no other has been the subject of more rancorous dispute as to its proper form, style, etc.

In spite of all, however, the breed has forged ahead, has gained continually in public estimation, and has made itself felt, both at the shows and in the pockets of the utility breeders.

It is a bold thing for any breed to stand up and claim egg-producing qualities equal to the Leghorn, yet the Langshan claims, through its friends, to have few, if any, equals in egg production.

To balance some of the difficulties under which the breed has had to labor, may be noted some advantages possessed, perhaps, by no other in the same degree. As to its own characteristics, the Langshan is of such ancient origin and settled type, that not even the experiments of certain ill-advised judges have been able to affect it, because it has been easier to keep it true to type than to change that type. In the case of newly-made breeds, the reverse is always true. Being black, which is a natural color in fowls—that is, one of the colors of the original Gallus Bankiva, from which our domestic poultry has sprung, it is hardly in a degree which, it is said, can never be equaled by birds of any color but the original black and red. It matures early for an Asiatic, and is of so equable, sociable, and docile a temper that it never loses anything through fretting or quarrelling. In this respect it has a real advantage over the Games and Mediterranean breeds.

Mr. F. L. Sewell, in a late number of the Reliable Poultry Journal, says that the Langshan has the smoothest skin and finest grained flesh of any fowl of its size. In amount of breast meat it is also pre-eminent. As Mr. Sewell is not only our best-known poultry artist, but a breeder and lover of the Langshan for many years, he is certainly good authority.

An outside help, if such it can properly be called, which has pushed this breed strongly, has been its own club. Every important breed aims to have its specialty club, and this club often makes the reputation of the breed. The part of the breed is to sustain this reputation after it is made. The Langshan has had, perhaps, the strongest specialty club of any breed ever placed before the American public, and it has nobly sustained the efforts of its club.

Those who have not given the matter much thought will, doubtless, be surprised to find that a breed wholly black has 29 points out of 100 allowed for color. The greenish sheen which the standard calls for has been found difficult to attain, as the bronzy purple is

constantly at war with it. White or gray in any part except the feathering of legs and toes is a disqualification, and as these blemishes often come from injury, an all black specimen with the proper sheen is not too easy to secure. In fancy breeding, neck and breast are the important sections in the Asiatic breeds. Each has 10 points, more than is allowed to any other section. Weight counts but 6; yet, as a bird below weight is disqualified, the breed is thus kept up to the standard. The pink bottoms to the feet are always insisted upon, as well as feathering to the extremity of the outer toes. The eyes must be dark brown, or hazel, and the face bright red. One who has raised and handled by lifting the seven-pound hens and the ten-pound cocks, will be ready to agree that this is sufficient weight for any breed.

### Sorting Out Dead-heads.

At one of the late institutes the question as to how one could with certainty detect "dead-head" hens—those not paying for their keeping—was brought forward. There are several schemes for self-registering nests, so that the flock owner may know to a certainty whether individual birds do, or do not lay. It is locally reported that the X-rays have been used to determine the paying value of a large ranch flock in California. But, aside from this, red combs, bright eyes, alert ways, and much music and "small talk" distinguish the layers, and those about to lay. Ten dead-heads in a flock of thirty, increase the feed bill one-half, while diminishing the rightful average one-third. Cull them out.

## Sleep With Both Eyes.

One can't afford wakeful nights, disturbed Sabbaths, maimed stock, cross neighbors and blasted hopes, all on account of a "cheap" fence. PAGE WOVEN WIRE FENCE CO., Adrian, Mich. Mention American Gardening when you write.

## DO YOU NEED WATCHING?

Or, to put it another way,

### Do You Need a Watch?

We sell them, sell them at such an exceedingly low price that you can't afford to go watchless.

Got 'em all sizes and styles.

But we'll just mention two:

An Eagle or Walrus Watch, best movement made, hunting case, accurate time-keeper, handsomely engraved, Duster Case, heavily gold-plated—last for all time. Ladies' or gentleman's size.

We'll send it to your address with privilege of examination. If it's not entirely as represented, send it back—costs you nothing. If you like it, pay the agent express charges and \$4.00. —That's fair. Or this—

A Hunting Case Watch—beautifully engraved case, first-class movement, any size, heavily plated (14k)—looks just like a \$40.00 gold watch—keeps as good time as any of them. Sent to your express agent with privilege of examination—same conditions as all our watches sent out—and if you like it, pay him \$3.45 and express charges.

If you take our word for it, and send money with order, a handsome chain goes with either, and express charges are paid by us, for the prices named above.

Mention American Gardening when

**A Poultry School.**

One of the interesting developments of the day is the proposed special course of poultry instruction at the R. I. State College. If sufficient intending pupils apply to warrant, such a course will be begun in January. In addition to the regular instructors, experts in special branches will impart their knowledge to students, and laboratory work is to be added to text-book study, and practical lessons in applied "henology." Withal, the course is given for the most nominal charge, so that it would seem that little more could be asked. Of course, it will be much in the line of an experiment, but let us hope a successful one.

**Stimulants and Medicines.**

It is sometimes said that the most successful poultry workers use neither of these adjuncts. Last week, one who desired a better egg-record, invested in a package of a certain so-called "egg-food." Used according to directions, it was found that the stuff would cost nearly three times as much as meat for the flock. No doubt it would stimulate laying, for it was red enough to consist of at least three-fourths cayenne. The peculiar odor betrayed the presence of fenugreek, and a caution on the wrapper that hens fed with this would need no oil-meal, gave presumptive evidence that this formed the basis of the nostrum. If one must use oil-meal and cayenne, better if it be bought cheap.

**Express on Fowls.**

Between the buyers who don't know, the sellers who sometimes don't care, and the express agents who don't want to know or care, express rates sometimes mount up woefully. Double rates are charged always on fancy stock unless in good slatted coops that handle and stack up well. Last week we paid 90c. on a single bird shipped a matter of 30 miles or thereabouts. The seller shipped the bird in a coop not falling under the express company's rule admitting to single rates, and when remonstrated with, made amends (?) by saying that express companies were soulless corporations. Common honesty in sellers is sometimes almost as valuable as conscience in corporations.

**Time, and the Leghorn.**

A recent writer makes a good point in discussing the care of the Leghorn, when he says that whenever he goes near the Leghorn yards he endeavors to carry himself as though time were no object whatever. This is really a cardinal point. Let a fussy, nervous, or even hurried person hurl himself like a catapult into the pens, and the tamest Leghorn that ever lived would show signs of imminent nervous prostration, or loss of faculties; and this, even though it were the very person who fed them every day. Truly, "the Leghorn is not a breed for every man."

M. V. NORYS.

**The Onion and the Teacher.**—In Topeka a school mistress forbade the eating of onions by the scholars, whereupon all the scholars took to the diet and the teacher was overpowered and yielded. In onion there is strength.

## Home-Mixed Fertilizers

A man can save hundreds of dollars by mixing his own fertilizers. He saves about half the first cost; he can use the materials best adapted to the particular crop, and consequently secure the best results possible for the money spent. *Nitrate of Soda* should be used to furnish the nitrogen (ammonia). It is not only the *cheapest*, but the most soluble, available, and in every way the best form of nitrogen.

**Free** A 40-page book, "Food for Plants." Tells all about mixing and using fertilizers. Please ask for it.

### A Review.

The year now closing has been an eventful, and in a measure, a disastrous one, to the fraternity. Never have there been so many good men out of employment, and this very frequently by no fault of their own, but mainly by the reduction of establishments and their expenses as they have existed; also from the lack of new places being created to keep pace with the increase in the number of gardeners. Both these causes are, of course, directly due to unprofitable times. Stock brokers and speculators, usually the most liberal supporters of gardening and gardeners, have not been in a position to do what they did a few years ago. Neither have other large investors been so well repaid.

The consequence of the foregoing conditions has been now as ever, that the garden, which in nine cases out of ten, is looked upon as a mere luxury, has been the first source of economy, and, is naturally the last to recuperate.

On the other hand, many men had to leave, owing to the overbearing nature and the demand made upon them by employers, who were ready to take advantage of the hard times, and the number of men whom they knew were out of employment, by reducing wages to such an extent that men could barely exist, and others by saddling increased burdens upon their unfortunates. Perhaps the worst case of all that has come under our observation was a few weeks ago, when an employer told his man that he could not afford to keep a gardener during the winter, so the man arranged to quit, and the employer noticing this and not wishing the man to go, made this extraordinary proposition. "You need not be out of employment all winter; stay here and take care of the place, and you can live and board in the house for so doing." The man refused the conditions and left, when another gardener was at once engaged on wages.

Death has worked havoc among some staunch supporters and their places are entirely or practically broken up. Three notable examples are: Ogden Goelet, Erastus Corning and Charles A. Dana; and as the year closes, Gardiner G. Hubbard, of Washington, has passed away.

At the early part of the year there was a tendency among gardeners, to make a grand rush to remedy all these troubles, and unfortunately, were led by leaders more blind than themselves—a course of action which, had it been persisted in, would have led to disaster in more directions than one. Fortunately for the toiler's sake, a more rational and moderate state of mind prevailed, and unionism for the time being seems dead, and it is well it is so.

There has been a noticeable increase in the formation of societies, and when these have been created in the right spirit, and promoted in a genuine way for the benefit of the community at large, they have been liberally sustained by

members of the craft and by their patrons. In others the plague spot of horticultural hypocrites, has displayed itself to the harm of all interested. One encouraging sign of the times though, has been the squelching of this in recent elections in various centers. Another feature which has manifested itself of late, is the wish of employers to know what is going on, and to be mixed up in it in some way or other, and their desire for knowledge on things horticultural has increased to a marked degree. In some instances of late, these gentlemen have proven themselves more progressive in their search for knowledge than are their gardeners, which has worked to the latter's disadvantage. In one instance a man claimed that none could teach him; but the progressive owner discovered there was room for improvement on his estate, and at once secured a progressive man.

These are the facts, let him who reads think them over!

### Orchids at Philadelphia Show.

To the Editor of American Gardening.

I am afraid Mr. Pericat, page 849, has not seen many collections of Orchids in America, or he would not say that of Mrs. Geo. B. Wilson is the most noted of all. It must be allowed the collection is very rich in *Cypripediums* which are in good health. The exhibit at the Philadelphia show was mostly made up of *Cypripediums*, with a few *Cattleya labiata* flowering for the first time, *Oncidium* and *Dendrobium* were very poorly represented. I think your correspondent is a little dissatisfied that he did not get first premium at the above show. But when the schedule calls for best "display," *Dendrobium phalaenopsis Schroderianum*, with *Cattleyas*, *Cypripediums*, *Vandas*, and *Oncidiums* in good variety, will always take the lead.—JNO. THATCHER, Wynnewood, Penn.

### Providence, R. I.

Thieves, presumably in search of floral decorations for the holidays, forced open a door in William Goddard's greenhouse, Power street lately.

### Assault on a Gardener.

Joseph Parishes, gardener to J. Park Esq., Port Chester, N. Y., was held up December 17 and brutally beaten by a tramp, who afterward tried to rob him. The gardener was walking along the highway when a roughly dressed man approached him from behind and asked him for a match. In drawing out the matches from his pocket, the gardener displayed a roll of bills, which the tramp eyed eagerly. "Give me that money!" he cried, and sprang upon the gardener and attempted to snatch it from his hand. The Scotchman was on his guard, and after a struggle flung his antagonist from him and ran toward the lodge gates. The tramp pursued him, and, picking up a stone from the road, brought it down on Parishes' head, felling him to the ground, where he was found by some servants. The tramp evidently thought he had killed Parishes, for he ran away, not waiting to take \$21 and a gold watch which his victim had in his pocket.

**Necessary Tools for Gardening in 1702.**

The following is a curious and interesting list of the tools and instruments considered necessary for gardening, by the author of "The Florists' Vade Mecum," a little work which reached its third edition in 1702: A Skreen for Fining. A Wier Riddle for sifting Earth. Spades two, a bigger and a less. Shovels two, a bigger and a less. Howes of several sizes. Pruning Hook and Knife. Grafting Knives, Saw, Chissel, and Mallet. Pen-knife, Scissors. Line and Rule. Trowels, broad, narrow, and hollow. Garden Sheers, a Hammer. Iron Rakes two, a bigger and longer in the head, a shorter with Teeth thicker set. A Rake with a broad Head, without Teeth for smoothing the Earth in a Bed. Several twig Baskets or Whiskets, and Birch Besomes. Watering Pots, one with a head full of small Holes; another only with a pipe; another with a small Neck, the bottom full of Holes. The first is to water Plants in Summer. The second to water Pots with rank Water wherein the dung of Sheep, Poultry, etc., hath been steeped, that it may be put to the Roots without staining the Leaves. The third being put into Water, will fill from the bottom, which will stay in so long as you stop out the Air with your Thumb at the top; this serves to water young and tender seedlings of Auricula, Gilliflowers, and such like, without washing the Earth from them, for by the Motion of your Thumb, you may cause the Water to fall gently upon them, more or less, as you shall desire.—Gardeners' Magazine.

# WHOLESALE MARKET REPORT.

## New York.

Cut flower trade for the past week was decidedly weak; outside quotations were difficult to hold; inferior stock sold at any figure that the speculator would hold out at, the market on this stock being entirely in favor of the buyer. Conditions are a little more favorable to the grower this week for the Christmas trade, and figures on fancy stock are rapidly moving upward as we go to press. American Beauty Roses are likely to make \$1.25 to \$1.50 each for specials; and extras are quoted at \$1.00 per 100; Meteor \$30, \$25, and \$20 per 100; Bride and Bridesmaid \$10 to \$25 per 100; other Roses in proportion. Valley \$5 per 100. Roman Hyacinths \$2 per 100. Poinsettias \$85 per 100. Cattleyas \$50 per 100. Violets \$1.50 to \$3 per 100. These are among the forward quotations, and it is expected that they will be easily maintained.

The trade in fruits and vegetables is brisk, and the market so far is well in favor of the grower and producer and there seems every prospect of the market cleaning out well by Friday night.

Hothouse stock seems to hang fire slightly, and is slow to realize. Grapes are moving slowly at \$1 per pound. Tomatoes are down to 10c., with 20c. as top price per pound. Lettuce are up slightly, the best grade making 75c. per dozen. Cucumbers have stiffened and reached the dollar mark. Mushrooms are too plentiful and the asking prices, 20c. to 40c. per pound, are not easy to get; a good deal of the stock is going to waste. Heavy vegetables and fruits are holding up well and likely to so continue. Turkeys are also holding up well and will, in all probability, remain firm; there is no actual shortage, but the supply is just about right to balance the market.

As regards Christmas greens, Holly is over-plentiful and very cheap. Bouquet green will clear out satisfactorily. Florida Pines are in excess of demand. Christmas trees are selling slowly and are far from profitable, retail buyers are

able to buy trees at 50c. per bundle, these containing one to five trees. A bundle means perhaps two 9-foot trees or three 8-foot, or perhaps five about 6 feet each. One hundred and nine cases of imported Mistletoe arrived per S. S. Paris and Britannic in fairly good condition; this sells wholesale at \$14 to \$25 per case, but this price will not hold.

Apples—Albermarle Pippin, Va., poor to fair, \$2@3; good to fancy, \$4@5; Winesap, Va., poor to fair, \$2@2.50; good to fancy, \$3@4.50; Johnsons' Winter, Va., poor to fair, \$2@2.50; good to fancy, \$3@4.50; King, State, poor to fair, \$2@2.50; good to fancy, \$3@3.50; Ben Davis, western, poor to fair, \$2@2.50; good to fancy, \$3@3.50; Greening, State, poor to fair, \$2@2.50; good to fancy, \$3@3.50; Baldwin, State, poor to fair, \$2@2.50; good to fancy, \$2.75@3.50; N. Spy, State, poor to fair, \$2@2.50; good to fancy, \$3@4; mixed lots, poor to fair, \$1.50@2; good to fancy, \$2.25@3.

Geese—Maryland, prime, per pound, 10@11c.; western, fancy, 9@10c.; western, fair to good per pound, 6@8c.

## Philadelphia.

The apple market has been quiet this past week; choice fruit was only in moderate supply and prices ruled steady. Kings, choice, per barrel, \$3.50@4; Winesaps, choice and fancy, per barrel, \$3.75@4; do. fair to good, per barrel, \$2.75@3.25; York Imperial, choice, per barrel, \$3.75@4; do. fair to good, per barrel, \$2.50@3; Ben Davis, choice, per barrel, \$3.25@3.50; do. fair to good, per barrel, \$2.50@3; Rome Beauty, choice, per barrel, \$3.50@4; do. fair to good, \$2.25@2.75; Greenings, choice, per barrel, \$3.50@4; do. fair to good, per barrel, \$2.50@3; Baldwins and Spies, choice, per barrel, \$3.25@3.75; mixed varieties, per barrel, \$2.50@3.

Cranberries, Jersey, per crate, \$1.75@2.25.

Florida oranges, per box, \$3.25@4. Grape fruit, per box, \$4.50@6.

Pears, Beurré Bosc, per barrel, \$2.25@3; Beurré d'Anjou \$1.50@2.25; Beurré Clairgeau, per barrel, \$2@2.50.

Grapes, Catawba, per 5-pound basket, 8@9c.; Concord, per pound basket, 7@8c.

Brussels sprouts, per quart, 5@8c. Cauliflowers, choice, per barrel, \$3@4; fair to good, per barrel, \$2@2.50. Cabbage, No. 1, per 100, \$2.50@2.75; No. 2, per 100, \$2@2.50.

Cucumbers, Florida, per crate, \$1@1.50. Egg plants, Florida, per barrel, \$4@5; per box, \$2@2.50.

Green peas, Southern, per basket, \$1@1.75.

Lettuce, New Orleans, per barrel, \$2.50@3.25; Florida, per basket, \$1.25@2.25.

Mention American Gardening when you write

Onions, white, per barrel, \$2.50@4; red, per barrel, \$2@2.75; Danver's Globe, per barrel, \$1.75@2.25; do. per bushel, 60@70c.

Radishes, Norfolk, per 100 bunches, 75c.@\$1.

String beans, Florida wax, per basket, \$1.25@1.75; Florida, green, per basket \$1.50@2; do. per crate, \$1.25@2.25.

Spinach, Norfolk, per barrel, \$1.25@1.75.

Potatoes, car lots, per bushel, 73@75c.; do. fair to good, per bushel, 60@65c.; Jersey sweets, per basket, 50@55c.; Southern sweets, per basket, 30@40c.

### Boston.

Cranberries are held firmly; if stock is fancy, \$7 would be a low quotation with perhaps 25c. or 50c. more if stock just suited customer. Crates steady \$2@2.50.

Apple market is in better condition. As fancy stock advances the next quality follows. Choice Greenings \$3@3.25, if free from scald perhaps could say \$3.50; fancy Baldwins we quote \$3.25@3.50, and yet we know some of the stock bringing as high as \$4; Talman Sweets continue \$3@4 a barrel; high-colored Ben Davis, not necessarily big sized, \$3@3.25; with some sales being made \$3.50; No. 2 stock bringing \$1.50@2; medium grades take a range from \$2.25@2.75.

Fancy cucumbers have had a big jump and easily bring \$15 a hundred; other qualities followed along, but did not take quite so rapid a stride.

Cauliflower \$2.50@3 for the best; small finds a hard sale \$1@1.25 a dozen; Brussels sprouts hang at 15c. a quart; no change in cabbage, 4@5c. each; red cabbage bringing \$1.25 a barrel; egg plants move at \$3 a dozen.

Virginia sweets \$2.25@2.50 a barrel; Jersey stock \$2.75@3; an easier market all around.

Spinach in lighter supply and bringing 60@65c. a bushel.

Celery barely holding its own unless it might be the Boston Market which pleases everybody; and is wanted at \$1.50@1.75 per dozen.

Nothing new can be said regarding onions, only \$2@2.25 a barrel, with some selected stock, large barrels, realizing \$2.50.

Oyster plant easy at 75c. a dozen; mint 60@75c. a dozen bunches; radishes 25@30c. a dozen; turnips can be quoted from 75c.@\$1.50 a barrel.

Prices of pears are unchanged, but market is so dull there is so little demand for them that it will be just as well we do not name any figures.

Leeks 40@50c. a dozen. Parsley 75c. a bushel; artichokes \$1.50; carrots 74c. @ \$1 a bushel. Beets or parsnips can be had at 50@60c. a bushel. Green beans from Florida are moving fairly well at \$3@4 a crate, while wax beans do not have that ready sale; if placed, go at \$2.25@2.50 a crate.

Strawberries are very pale, not an extensive demand, bring 50@60c. a pint. Nothing new can be said about lettuce, remains 30@40c. a dozen; Romain 50@90c. a dozen. Escavallas 50c.@\$1 a dozen. Chicory about 75c. a dozen.

Asparagus shows up, dealers asking 50c. a bunch, very little sale. Home-grown mushrooms 50@65c. a pound, while York State moves at 30@40c.

The only tomatoes wanted at present are home-grown hothouse stock, which is fairly steady, 15@25c. a pound.

Hothouse grapes take a range of 75c. @ \$1.50 a pound, according to variety and quality. Pineapples 25@50c. each.

Green Mountain potatoes fairly firm 80@85c.; Hebrons and White Stars 75@78c.; red varieties 65@75c.

Hubbard squash in carload lots \$25@30 a ton; near-by selections 2@2½c. a pound; Bay States \$1.25 a barrel; Turbans \$1.50; Marrow \$1.25@1.50.

There is fully as large a demand for all fruits and vegetables as usually exists at this season of year. The market is well supplied with all kinds of evergreen: wreaths, trees, holly, mistletoe, and everything else to make the home look pretty.

# OUR CLUB LIST

LET US FILL YOUR ORDERS FOR 1898.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

Which we know our readers will appreciate.

And with all this

{ Array of  
Attractions

## We Give Premiums

To those who obtain us a new subscription as well as to the new subscriber. See advertising columns.

Don't fritter away your time and money on worthless reading. Subscribe to a practical publication, admitted by all the standard authority of the age and country. Take our advice: Talk American Gardening to your friends, get their subscriptions, and they will bless you evermore.

# Potash

is one of the three important ingredients of a complete fertilizer; the others are phosphoric acid and nitrogen. Too little Potash is sure to result in a partial crop failure.

## Free

An illustrated book which tells what Potash is, how it should be used, and how much Potash a well-balanced fertilizer should contain, is sent free to all applicants. Send your address.
